Re: [Tutorial]Program Cable Pin-Out and Frequency Range Modification

Guys,

I made the programming cable by myself and it is working
fine. I have Intek HR-2040 but as it was explained on this forum it is the same
radio as AnyTone… So pin 8 (Keypad Serial Data) is used as Tx/Rx line and
pin 1 as a ground.

Ok well I'll ask a friend who makes cables and then reply back with how
it's done. Should be a pretty simple solution on how to make a 1 line
rx/tx data from the radio to the chip.

Re: [Tutorial]Program Cable Pin-Out and Frequency Range Modification

Guys,

I made the programming cable by myself and it is working
fine. I have Intek HR-2040 but as it was explained on this forum it is the same
radio as AnyTone… So pin 8 (Keypad Serial Data) is used as Tx/Rx line and
pin 1 as a ground.
Regards,
Paul

[Tutorial]Program Cable Pin-Out and Frequency Range Modification

I
sense some confusion here. The Pin 8 on Page 10 is for Keypad Serial Data, not
Programming data. I believe the previous cable poster was using 568B Cat5
wiring colors and if so, then Mic Connector Pin 1 is GND, Pin 2 is Rx Data, and
Pin 3 is Tx Data. These programming connections are not shown in the manual.

2075. Single RxD TxD data line

Yahoo group: Anytone_AT-588UV
Date: 2013-07-31 00:32:18 UTC
From: Milton Hywatt
Topic: 2075 Message: 2075

http://e2e.ti.com/cfs-file.ashx/__key/communityserver-discussions-components-files/166/4503.OneWire.bmp

On the radio end you could drop the VCC connection and the diode on the
TX and feed both to the serial data line of the radio. The chip driver and programming
software would use Half Duplex communications as not to loop data.
This is why sometimes software like Chirp is slow to read the radio's template.
Because it is not full duplex so acks and retries are sent then the line switches
back to RxD to receive these packets and so on and so forth.

Well at least I understand now via half duplex, the two sides communicate.
I didn't read your link yet but found out on my own that in order to transmit
and receive serial data over one line half duplex is employed. and I think
the diode on the radio side plus the VCC can be discarded if you have a single
input.

This won't help, the file is only 503 bytes. Please do not upload this software to the group. You can't upload it this way anyways, Yahoo doesn't allow it.

hi I was using the cross band repeater while on simplex the other day works lovely

was just wondering if I could use the cross band repeat if I was using a repeater I no it will re transmit the audio received but when I want to transmit it doesn't let me

is there a way to disable the frequency lockout if you get what im saying

regards Nathan

I own two AT5888UV radios and I use one almost exclusively
as a cross band repeater. VHF out to a repeater that transmits
tones only when it receives a signal. VHF at tone decode back to the AT5888 then cross band to UHF then back to the handy talkie. All using the repeater tone frequency (which is not needed to access the repeater)
of 110.9 for encode and decode. That's the only way I can describe it. From you description it appears your
squelch opens on your remote radio but you hear no voice?

hi I was using the cross band repeater while on simplex the other day works lovely

was just wondering if I could use the cross band repeat if I was using a repeater I no it will re transmit the audio received but when I want to transmit it doesn't let me

is there a way to disable the frequency lockout if you get what im saying

regards Nathan

I think maybe Nathan is trying to Transmit on the Anytone while it is in XBand repeat. That does not work on my 5888UV. It is purely a repeater with no way to use the local microphone.

Ahh ok, h
ard time understanding the first time around but now
it makes sense. My old #00039 has been on x-band now for 4 hours.
Darn near continuous use into a repeater I can't access with an HT.
Running at mid power and no extra fan on top it feels warm to the touch
but not as warm as when it sat atop the dashboard in my truck in the sun.
Still doing 59 watts out on VHF the old gal seems pretty stable. Wish I
could ID regularly but I listend a long time on the UHF side and never heard
traffic. I did shut it down for a minute to ID on UHF every 30 minutes, that's
the best I can do. Used to run the Yaesu dual bands the same way from as far back
as the late 1990s without complaints. And the compliments I've gotten using the
AT5888UV in x-band as to how transparent it is makes me happy. Finally, I can
run the AT5888UV full power on VHF and UHF. I could not do that with my $560
Yaesu FT8900 as it would start slapping back until I turned x-band off.

I use the Comet CA-2X4SR-NMO Broadband vhf/uhf dual band antenna. This has worked great for my install. What I like about this antenna, is its designed for amateur radio and also emergency public service band on my install. It does come in both mounting formats. cheapham is the cheapest place I've found it on the internet. No connections with cheapham, just a happy customer. Also linked is the Eham reviews of this antenna. Ive had it on my truck NMO mounted to my roof and am very impressed with the antenna and radio performance.

The Depending on the antenna base which you made no mention of being UHF or NMO, the Comet CSB-750 for UHF mount and the Diamond SG7500NMO for NMO mount. I own both, the 7500 for about 15 years and besides being superior performance-wise, they are also rugged and have the fold-over feature that you can lift the antenna out of the load coil and lay it horizontal. I use that feature a lot. Most of the time I listen and both antennas receive well horizontally. And as a matter of fact you can get either antenna in NMO of UHF. I think the UHF mount is more sturdy having maybe twice as many threads. But I've never had problems with NMO. But general feelings are the taller the antenna over 45", use the UHF mount.

To do a simple repeater with no tone, put radio in VFO mode, use Set to get menu items and set the Offset and Direction. Then enter the Rx frequency and it should hit the repeater. When you press PTT check to see that the Tx frequency is correct. To add Tone, leave everything as is and use Set to get to Menu for desired Tone and once selected, the radio is ready for repeater with tone operation. Then save it to an unused channel if you want it permanent.
The key to understanding manual programming is to recognize that menu items like Offset, Direction, and Tone are permanent until changed. Selecting different Rx frequencies does not change these menu settings.

jwheatlyus gave a good description to program by hand.

It would be great to make a video tutorial of how to operate
the software, something that maybe I or John should work on.
I've just been too busy remodeling my home the past several weeks
as I don't have money for profesional carpenters so I'm doing it
myself. Anyway if our radios were the same firmware version
you could email me off group with a list of repeaters and simplex
channels you want, I could enter them into the software and make
a template you can then upload to your radio. That way you can
go through every aspect of the software and then add or delete channels
in the future. Also I'm not sure the firmware matters, I have two radios
that have different firmware and I use the same template for both.

I personally would appreciated a Video tutorial on simple things such as programing the repeaters and adding frequency's to memory.
How to to the simple thing the right way instead of sitting up all night pressing one button and see what that does and when your done something wrong you do a reset on the radio and start again.
I am now into my second night now .
But using the software i have got 2 repeaters in the Sydney Basin. Although the software some times need explaining in its self.

Ok all sorry for the gripe but i am only a brand new call. And it is still all so very diffrent to me

Cheers John

Yes I have just spent all night getting a copy that recognises my radio.
Now I need to learn how to use it properly. I don't know it is all hard work so far, and no fun,

As for the other fellow comment I was trying to append one at 588 file on to another by starting 2 copies of the software and loading some frequencies from their and pasting it into another file I had created.
So no 2 copies of the software on the same machine at once.

That's all I was trying to do. Now I will spend 2 days teaching my self Chirp

oh yippy this is going to be fun.
Cheers John

And you can actually import repeater data from the internet by
the county you live in. It actually fills all the spaces in for shifts
offsets, frequencies, and I think alpha tags and any tones.
Not sure if there is anything for other countries though.
I use Chirp just for that. It is slower the the QPS software while
transferring data but that isn't a big deal. And you won't find any
extended settings that are in the QSP software, just the basics.

Join the Chirp users list

http://intrepid.danplanet.com/mailman/listinfo/chirp_users

They will happily help you get on the right track to utilize their
software to its fullest potential.

Yes I have just spent all night getting a copy that recognises my radio.
Now I need to learn how to use it properly. I don't know it is all hard work so far, and no fun,

As for the other fellow comment I was trying to append one at 588 file on to another by starting 2 copies of the software and loading some frequencies from their and pasting it into another file I had created.
So no 2 copies of the software on the same machine at once.

That's all I was trying to do. Now I will spend 2 days teaching my self Chirp

oh yippy this is going to be fun.
Cheers John

You can import CSV files directly into Chirp. You mentioned
you are learning to use the software.

A better way than "quite fast" ? The only better way would be to know someone that lives close to you and knows the AT5888UV and Chirp and the QPS software inside and out. Then they could take you by the hand and walk you through programming your radio while they know personally your computer skills.

I think what get lost here is that once we manage to get through everything. Everything else seem to just get lost in life.
But everyone else is struggling as well. Especially new members it is why they join these groups in the first place, because they need help.

Although I have found that this group will get your questions answered quite fast. All I am saying is that there must be a better way.
Cheers All John

You will find in time that by bits and pieces you
will learn the essentials of the QPS software. Myself
and others have suggested Chirp as an alternative.
Much simpler to use and they do have a user list
that serves much like this group. I'll give you the
address again. I strongly urge you join the Chirp group.

I personally would appreciated a Video tutorial on simple things such as programing the repeaters and adding frequency's to memory.
How to to the simple thing the right way instead of sitting up all night pressing one button and see what that does and when your done something wrong you do a reset on the radio and start again.
I am now into my second night now .
But using the software i have got 2 repeaters in the Sydney Basin. Although the software some times need explaining in its self.

Ok all sorry for the gripe but i am only a brand new call. And it is still all so very diffrent to me

Cheers John

Warning!

Chirp is great, I imported about 200 repeaters at once from a CSV file I exported from a New England repeater site.

I did find a bug that left a bad taste in my mouth, somehow it lost my PL tones, not all, but many.

It was great for the massive import, but I am sticking to the AnyTone software now.

Well for what its worth...I put off dealing/programing because of some of the stories I read. Well troops I use current software frm Anytone W/O issues

I know RT systems has a program out for it and I use theirs for my Yeasu 817 & 857, but other than getting use to different pulldowns it wasn't bad at all. Justing saying. Oh yes. I have a mix of public service and amateur freqs, all working correctly. Wheew

2110. Chirp, Done

Yahoo group: Anytone_AT-588UV
Date: 2013-08-06 17:35:21 UTC
From: mindman_au
Topic: 2110 Message: 2110

At least I can programme frequency's. Now the next problem is this the paperwork on the uv tells me we have groups that we can add frequency's to such as aviation in one bank uhf in another and vhf in another.
I promise to quite the group if I can find out how to add memory groups and then how to add to the group manually. Because I cant see how chirp will do it. and QRP is not very intuitive.

Cheers

There are two hyper memory groups where you can place channels that give you quick access to. I think they hold 4 in both. But there are no memory banks that you can switch two. One example is a Yaesu FT60R which has roughly 1000 memory channels in the standard memory mode. Now when you go into the banked memory mode it splits the 1000 into 10 banks of 100 channes each. I don't think you'll find that on the 5888UV. Remember the 5888UV is a Land Mobile Radio first and foremost. And while it shares similar functionality with true ham radio mobiles, it does omit some of options only found on a ham radio mobile. Like being able to program the Home channels. Those are fixed at one per band of reception. If I'm wrong about the main memory, someone chime in and correct me.

I've not seen a single mention of that bug in the users list
for Chirp. The dominating dialog seems to be programming
these Baofeng UV5R and variants hand helds.

And I can use Chirp for Mac on this laptop. for my Chinese
hand helds and the AT5888UV because the cables both use
the same driver.

Ron,

How are you connecting your AT-588UV to the SignaLink?
Both when you wrote this and any improvements you've made.

Were there any settings you had to change in the radio to make it work?

Thanks,
Irv W4IWK

2114. "fluttering" squelch

Yahoo group: Anytone_AT-588UV
Date: 2013-08-07 22:11:30 UTC
From: Wayne (W6WAT)
Topic: 2114 Message: 2114

My radio has started to emit fluttering static and white noise on most of the memories on whichever band is not the "main" band in use. I've tried muting the secondary band, yet it still does it. I've set the Squelch to the highest and lowest levels and all in between. I've tried to change the "SGN SQL" settings, but there aren't any options available to change.

When just monitoring on both bands and scanning, the radio will stop on white noise and static. When the radio was brand new, it didn't do this. Now that it's a few weeks old, it's started this strange behavior. The radio has never been mobile. It resides on a desktop connected to an Astron 35A power supply.

Any ideas?

Wayne

I can't explain it but one of my 5888's will make a crackling noise on a received channel around 155 mhz if that channels is not on the main side. However drop 8 mhz to the 2 meter band and there is no crackling. Oh and get ready for this, it only happend when I'm in motion and only when receiving 155 mhz on the sub side either right or left. I know this doesn't help you but if you program your radio with a computer and have a previos template with all your frequencies you might try a factory reset if you haven't already. These radios are totally under the control of the software image loaded. And the standard settings loaded during boot. If you get some corruption in that image it can cause odd problems with the radio.

Yes, when my microphone speaker is turned on, I occasionally get squelch noise/fluttering associated with nobs turning, turn signals, brakes, etc. When I turn off the microphone speaker, in the radios menu, it stops.

I have an external speaker running from the radio, so cannot speak to how the radio will react w/o the external speaker attached.

I have an external speaker running from the radio, so cannot speak to how the radio will
react w/o the external speaker attached.

2120. Radio-Tone Simplex Repeater Controller

Yahoo group: Anytone_AT-588UV
Date: 2013-08-12 18:54:45 UTC
From: w3pcj
Topic: 2120 Message: 2120

Hello,

I would like to set up a Simple Simplex Repeater for our C.E.R.T. Team.

I want to us the Radio-Tone Simplex Repeater Controller and my Anytone AT-5888UV.

Can anyone tell me what hook up cables I would need to order or better yet is the Anytone AT-5888UV set up with it's microphone jack like another brand radio?

Thank you for your time.

-Paul

In the owner's manual at the end of chapter 4 (Getting Aquatinted) you will find the pinout for the 8P8C connector. Looking at the front of the connector with the lock tab at the top
the pinout is left to right 1-2-3-4-5-6-7-8. Pin 1 is ground. Pin 2 is PTT. Pin 3 is microphone. Pin
4 is microphone ground. I don't know the difference between microphone ground and ground but
you can always try either. If your simplex repeater has a common ground for PTT and microphone
use pin 1 for ground. If the PYY ground and microphone ground are separate, then use accordingly.

That's cool! From my discussion with someone who makes cables, he says that it's good old serial data protocol. And that to keep the data from looping half duplex is used. Now did you just tie the TX and RX lines together? Or did you use a diode or two, something like what is used to combine TX and RX on one end and split it at the other ?

That's what I figured. I know how to combine rx and tx and then separated it so you can send it over a two conductor cable But I guess the data being sent and received at simplex rather than duplex won't interfere with each other. The only consideration of mine was how the UART would react with rx signal back into the tx pin and vice versa.

I had a nice tri band modular radio from Kenwood. It was a TM-742A and would accept up to 3 modules for various bands including 10m. It had the ability to remote the control head, as well as pump remote speaker audio out for each band. Unfortunately, it's no longer in production, so check the used radio market.

Mine had the control head mounted atop the steering column, the radio under the driver's seat, and a speaker for each band behind the front seat (mounted in a pick-up) across the back panel. I also had an FT-100D with the control head mounted to the anchor point of the rear view mirror, and the radio under the passenger seat. The remote speaker was across the back panel with the others. There was a rocker switch mounted in a factory dashboard knock-out for a standard screwdriver antenna. It was a sweet setup, but with my newer truck, I was very lazy.

2130. tail eliminator setting

If it's a ham repeater I've found that many only transmit PL tone when actively receiving a signal. This means that it will not transmit tone for the tail. Find out the encode tone of the repeater if any and add it to your channel. That should get rid of the tail. I've found with police and public service repeaters that have that 1200 baud screech at the end of keyup, there is nothing you can do since those repeaters transmit PL except for repeater ID.

I have not actually used the Tail Eliminator Type setting on my radio, but since the choices are 120 and 180 degrees, these settings are 'Reverse Burst. Here is an excerpt from RepeaterBuilder.com.

"Reverse burst or Squelch Tail Elimination ("STE") is a process that uses a change of the phase of the PL tone encoder for a short period of time after the user unkeys the PTT button. The term "reverse burst" is used to describe the deliberate phase change for a specific abount of time while the transmitter carrier stays on - about 150 to 200ms - with the phase of the PL encoder offset by from 120 to 180 degrees (180, naturally is a complete reversal). During the reverse burst time period the reverse phase stops the PL decode reed dead in its tracks - which slams the receiver squelch closed right now. By the time the transmitter actually drops off the air the RX squelch is already closed - which results in no burst of squelch noise being heard."

Well neither 120 or 180 work on our PD system. And since the
CTCSS is on the entire time the repeater is transmitting the
setting to squelch the tail if the the repeater is not transmitting
CTCSS or DCS isn't an option. But as I said with ham repeaters
there are some in my area that only transmit tone if it is receiving
a signal. Doesn't matter if that signal is tone encoded or not. So the
universal setting to eliminate tail when no CTCSS or DCS is received
would work fine. Or you could do it on a channel by channel basis by
just decoding tone. This is how I do it with crossband repeate. I have to
or I cannot break the repeater squelch while it is transmitting the tail.
Not good on an active repeater with a severe weather net going on. Nobody
waits for the repeater to drop.

Please everyone trim off old messages from your replies. Makes reading easier and finding your comments possible.

The reverse burst setting (debatable if even in this model) would apply to your radio's transmitted signal. Not to what you receive because that will always be active - you cannot turn off something that you are receiving and have no control over.

If I recall old history right... There are 2 values because the commercial radio industry got into a pissing contest. Motorola and others were using 180, and I think Kenwood then changed to 120. That way a Kenwood radio was tweaked to "work right" on another Kenwood transmission best (as a sales point), but not quite as good on a Motorola.
But both do a good job of eliminating a trailing squelch burst on the receiver's radio because it kinda snaps it into reverse, closing the PL quicker than letting it decay because of loss of PL.

Milton, the only effect you will notice in your local PD repeater is when it stops transmitting PL, apparently after the tail time. If they are transmitting a reverse PL, then your receiver will mute quicker than if they do not transmit it. Your radio's settings will not change anything.

There is one possible exception to the setting. Some commercial radios can be programmed to optimize their logic for 120 or 180, but I've never noticed any obvious difference to make it worth adjusting.

I see this subscript error on occasion. Have not been able to pin it down, but by returning to Normal Channel Edit before writing to radio seems to help. Whenever I make changes, I Save immediately to avoid losing the changes in case the subscript error pops up.
Have seen the error while programming two radios and using three computers.

If you run Windows 7 try running the factory software in the compatibility mode. I run it under the Windows XP settings and there are only a couple things that will cause it to crash. Yesterday it ran fine. Before you upload, save the file so you can find it. Close the template and open the template you just saved to your PC. That plus the compatibility mode should cure your problem. I'm finding now that I don't even have to do that. Just download from the radio, made changes in the tail settings a couple times and uploaded them to the radio without saving the file first. In any event if you make a lot of changes, import a lot of channels you will want to save your template first, if the program crashes you've lost a lot of work.

From: Milton Hywatt
Topic: 2140 Message: 2141

I have a schematic and block diagram for the AT-588 but that is a different radio being UHF only. Someone sent it to me thinking it was for the AT-588U/V.

There is a pinout of the speakermic in the user's manual at the end of chapter 4 Getting Acquainted. But there is no connection for the speaker given. Only thing I can guess is that audio floats into the mic on the key pad serial data pin 8. All the communications from the radio to the control head are on the serial data line between the radio and the control head. So it wouldn't surprise me if it also sent digital audio data to the speakermic where it went through digital to analog conversion inside the speakermic. That probably accounts for to extreme amount of digital noise from the speaker in the speakermic.

So the only way to get headphone audio would be to use a stereo to mono adaptor for the 3.5 mm jack in the back of the radio. Otherwise you will just get audio in the left earpiece.
And unless you can make a lowpass filter to put in line you will not be happy with the audio.

Also, the mic preamp board is part of the RJ45 8P8C connector for the microphone and is located inside the control head.

Subject: [Anytone_AT-588UV] AT 5888UV MIC SCHEMATIC AND PINOUT

I want to connect a headset to my AT 5888UV instead of the handheld mic/speaker that came with it. The hand mic has a speaker but the pinout does not show any of the pins with receive audio. Is there a mic preamp in the handheld piece? Does anyone have a schematic of the hand mic? Thanks. N7RTG

For those unfortunate enough to buy a cable with a counterfeit
Prolific 2303 chip inside you can't use newer drivers than what the
cable came with. If you try a driver newer than 3.2.0.0 the driver
recognizes the chip as a counterfeit and won't work. Haven't seen that
so much with the Anytone radios especially those that had a cable
bundled with them. I've uploaded a PL2303 test program to the files
section of the group inside the Prolific folder. As soon as I can find
it on my Windows computer, I have a Prolific chip identifier. It may tell you
if the chip is counterfeit. The tester program may help determine
if the chip is working properly. I haven't tried it yet but it looks like
it does several checks other than just echo data back. These two small
programs may help troubleshoot crash problems. I don't know for sure if the
QPS_AT-5888 software is sensitive to drivers like the Baofeng software is
but it is a possibility.

2147. Chinese fuses

Yahoo group: Anytone_AT-588UV
Date: 2013-08-24 21:31:12 UTC
From: Milton Hywatt
Topic: 2147 Message: 2147

Chinese glass AGC type fuses are the scourge of amateur radio.
I started having problems with both my 588UV radios turning
off occasionally while transmitting. The one in my SUV first.
I thought it might be the fuse holders inside the engine compartment
I installed on the 8 gauge stranded wire from the battery. But
those are the current spade ATO 25 amp fuses inside two well
sealed rubber holders that are capped, and some silicone grease
surrounds the contact areas. Both in good shape. So I popped open
the radio's fuse holder, the holder is just two fuse caps and the plastic
external snap together body. I pulled one cap off one end of the AGC
glass fuse and the whole damn end of the fuse pulled off. Well
BINGO! Went into the house and did the same thing to the 588UV
I use for a base and BINGO, pulled the end off that fuse too. And
I was pulling very lightly because it doesn't take much force to just
take the holder caps of the fuse. Took a ride to the local auto parts
joint and bought a 5 pack of 20 amp Buss fuses. At lease I'm pretty sure
are still made by Cooper Bussman in the USA.

Moral to the story: check the fuse if you have voltage supply issues especially
the radio going dead on TX. There is also an internal 15 amp fuse that might
suffer from having a loose or improperly soldered whisker. Don't discount it.

From: mwilsonemt
Topic: 2150 Message: 2150

Hi all,

I having an issue with my 5888uv where when in crossband mode, I can transmit VHF from my ht and the radio will rebroadcast on UHF, but when I tx UHF from my ht, I get a hiss of static for about 1 second and then nothing is repeated, and the radio doesn't show anything being received by the UHF side. As soon as I turn off crossband, the UHF starts receiving again. I have tried swapping which band is on which side of the radio, but the issue follows the UHF. I have also turn off all tones to ensure it wasn't a tone issue between my two radios.

Anyone know what I might be doing wrong, or does it sound like I have to send this radio back?

Thanks,

Mike

Adjacent channel rejection, random interference when the squelch is closed and there is no signal on the frequency. Thanks.

Ok now we're talkin. I'd give the radio a 7 out of 10 for adjacent rejection.
It is made to operate at 12.5 khz channel spacing. But at amateur channel spacing
of 25 khz it might not be as good as an actual amateur radio. I don't have any problems
with adjacent channel rejection even on a 30 foot high Cushcraft AR270B antenna.
Your random interference with closed squelch is I think you mean intermodulation
distortion. This is where a strong signal swamps or takes the rx front end of the radio
out of linear operation allowing signals from close by frequencies to mix and open
your squelch. I've heard some report in an RF rich environment that this can occur
on this radio but it can be reduced or eliminated by a unity gain antenna. Personally
I've only experienced it a few times using a high gain dual band. And I've experienced
the same (not necessarily on the same frequency) on my Yaesu FT8900. So it is an
expected, at least for me, situation where you just have to find a way to work around it.
You could use tone, rf squelch to try to rid your radio of intermod. The AT-588UV has
a very hot receiver which I like. On the bench it was still breaking squelch and receiving
a test tone at -127 dBm and the source of the RF (General Dynamics R8000 would go no
lower in signal than than -130 dBm. Around here, I don't have an rf rich environment
so the great receptions trumps the intermod especially when I know that this has been
a balancing act between manufactures in the scope of being cost effective or carrying
along a load of expensive filters and circuitry that you'll spend $500 for a dual band ham
rig. So weight out your needs, expectations, the facts and private testing results of the
radio
and the price then make your decision.

Good day. I am trying to justify the purchase of the Anytone AT-588UV vs. the FT8800 and I can't seem to find a reason to choose the Anytone. One concern I have is service. What happens during the warranty period if the radio requires repair? Do they have a US Service Center? Also, for less than $40 more, can have a proven performer. I don't need transmit ability on any public service bands. Can some one help me sort this out? Thanks and 73.

With the $ 100 rebate it is hard to turn down the Yeasu. One thing going for the Anytone is you get about a $ 40 computer cable and programming softwear with it. That makes you $ 80 over the Anytone.

If going to the Yeasu, You might as well go to the FT-8900 for a few dollars more from AES. They are including the remote kit for what it is worth on some of the Yeasus.

Update, and a big thanks to Milton. I have a Baofeng uv5r and it was the driver that was causing my problems. I updated the driver and now the factory software works fine. One weird thing is now the Baofeng cable and software now works with the newly updated driver where it would not before. Thanks again Milton and all who replied.

The FT-8800 is a great device, have used it fr years and have many other Yaesu units. However, I just sold two of my FT8800's, and then I purchased the Anytone. Both are very similar units, and everyone has their own reasons for picking one over the other, but I did it for three reasons (Ham and commercial usage, commercial narrow band frequencies capaility, and two tone alert capability).

Glad to help. Now I have an off topic question to ask you. You can answer
off the list if you wish. I'm sure the answer is simple. I own a UV5R in the
form of an F-11. Made for amateur frequencies only. When the radio is in
the dual watch standby (TDR ON) mode I can't switch the bottom channel.
If I press the A/B switch the up down buttons still only change the top channel.
Do you know of a way around this? Give it a try.

Keep in mind that the UHF (70 cm) band is roughly the 3rd harmonic of the VHF (2 mtr) band, and it is possible you are de-sensitizing your UHF receiver with the VHF signal (can work the other way also). What are the specific frequencies involved? Multiply the VHF freq by 3 (or divide the UHF by 3), see if you end up at or very close to the other frequency. If one side or the other is a repeater, also check the offset frequency.

Also, I would ALWAYS tone guard the receiver for any cross-band link. That's just good practice. It might also help you narrow down the problem, especially if you are using different tones for the two bands.

I run one of my two 588UV radios basically for crossband to a VHF repeater I cannot hit from my HT. First I used a Yaesu FT8900 and soon found out that the VHF and UHF interfered with each other if power out was 25 watts or more. Well that was ok with me but when I got my first 588UV I noticed that I could run both sides at the highest power output with no interference. I thought HOT DAMN this is a pretty decent radio to be able to pump 40 and 50 watts in and out of the same antenna a Cushcraft AR270B 30 feet at the base on 9913 coax. So in conclusion, yes harmonics can be involved here. And for best operation tone the radio and remote the same as the repeater even if the repeater only sends tone if it is receiving a signal, tone or not. This way you won't need to wait for the tail to end before you can transmit.

You can buy a FT8800 from Universal Radio for $359.99 after a $100 dollar rebate. I own two AT-588UV radios and an FT8900. All three have their quirks. I do like a lot of features on the AT-588UV, some I don't but you'll have that. I've owned a lot of different single and multi band mobile radios in the past 22 years. I don't know where you can send Anytone radios for service. Right now it's just an exchange if your supplier is willing. So it's really a toss up and one reason I do not care to entertain these questions in this group.

Subject: [Anytone_AT-588UV] Justifying Anytone vs Yaesu FT8800

Good day. I am trying to justify the purchase of the Anytone AT-588UV vs. the FT8800 and I can't seem to find a reason to choose the Anytone. One concern I have is service. What happens during the warranty period if the radio requires repair? Do they have a US Service Center? Also, for less than $40 more, can have a proven performer. I don't need transmit ability on any public service bands. Can some one help me sort this out? Thanks and 73.

2162. Anytone AT-5888UV in helicopter

Yahoo group: Anytone_AT-588UV
Date: 2013-08-27 23:06:22 UTC
From: correllsvcs@bellsouth.net
Topic: 2162 Message: 2162

I am replacing an existing multi-band radio in a Robinson R44 with this model Anytone. The object is to use an adapter cord, instead of the factory supplied microphone, through an NAT AA34-300 audio conditioner. This will allow the air crew's headsets to transmit on the Anytone through the helicopter's existing audio system without having to use the factory external mic. I have accomplished this using Motorola, ICOM, and several other brands of non-aviation radios. My problem is that I can get the Anytone to key but no matter what I try, I am unable to achieve transmit audio. All I have is carrier wave. The factory schematic shows #2 pin PTT (push to talk), #3 mic audio high, #4 mic ground. The existing multi-band radio worked absolutely fine using those 3 inputs. The Anytone does not.

Does anyone have any suggestions on this? The US distributor has directed me here for a resolution.

Thanks.

My suggestion is to check the Anytone microphone output level. It has a condenser mic element powered by 5 volts from the radio. So it is a medium impedance element. The NAT 34 - 300 calls for low impedance but I don't think that's an issue. Being a repair tech working under a commercial license, the steps I would take are thus: Determine when the millivolt output of the NAT 34-300 is while disconnected from the radio. Should be 275 millivolts max You will need a meter that can measure AC millivolts. Once you've determined the 34-300 is providing its rated output, and you should be able to accomplish this by speaking loud into your headset mic, I would then attach the radio and see if you still have audio out of the 34-300. If so, go to the input of the radio and check there. If you have the proper level of voltage at pin 3, plug the radio's mic in and see if it works. If it does then I'm stumped and would call my boss and ask him. But if you have voltage into the Anytone, it should modulate especially if the stock microphone works. Oh, and if you can check how many millivolts the mic has out on pin 3 that might shed some light. That's about it. Myself I have a General Dynamics R8000 portable communications analyzer that I would use the scope function to determine if my microphone output and the output of the NAT are close enough to work. Or if you have made an error in wiring or crimping an end on the adapter cable. It's odd not to have any modulation whatsoever.

That's fine just contact me off the list via email. I'm not much of
a morning person after semi-retirement and I'm usually busy until
5:AM. Do a considerable amount of work for the amateur radio community
out of my house where I have my trusty old IFR 1200 Super S com analyzer.
Good for most repairs and recently calibrated. I think with a little guidance
we can figure out what's wrong.

I know you won't read this because you unsubscribed after you sent this message.
But for others reading, I set limits in MY group otherwise it would be a free for all.
And discussions of what's a better radio to buy does not help those who might want
advice on their AT-588UV that they own. So if your only intent in subscribing to this
group is to try to determine if the radio is right for you, then unsubscribe NOW and
start your own Yahoo group and run it the way you want. And as far as having a fiduciary
relationship with Anytone, I don't other than getting a bit of a discount in some
products from a reseller I suggested creating this group for to support the AT-588UV nearly
one year ago.
So which is better and what should I buy topics are taboo. The group fact indicates
discussion about competition is discouraged.

No my UV-5R setup menu TDR is menu #4 and its either on or off. Menu #34 is TDR-AB it can be set A, B, or off. If its set off you should be able to change between an A and B side. If its set to A and you try to use the AB button it will go to B and jump right back to A and vice versa. Hope that helps.

2169. Desk mount for AT-588UV?

Yahoo group: Anytone_AT-588UV
Date: 2013-08-28 18:57:53 UTC
From: w4iwk
Topic: 2169 Message: 2169

Any suggestions for a desk mount for my AT-588UV?

When it's flat on the desk, I can't read the display. Something that raises the front up at a 45° angle would work. So would a suction cup stand with an adjustable arm.

Searches yield large numbers of mounts but they're made for smart phones, tablets, or large monitors and it's not clear which if any would work.

Anyone have something that you're happy with?

Thanks,
Irv W4IWK

Use the mobile mounting bracket underneath instead of on top?
I'd have to fool around with it but I've done that with other radios.
Right now mine sits on top of my HF rig with a piece of that rubber
netting you use for lining your kitch shelves. But if you have that
bracket and some 1/4 inch thick plywood, a saw and a few nuts and bolts
you should be able to whip something up suitable.

Someone had mentioned to me they used a "Tablet Stand" for such a situation ...
Probably something like this one sold by Amazon for $5.99 would do the trick....
http://www.amazon.com/Universal-Adjustable-Blackberry-Playbook-Cosmos/dp/B00523M4RC/ref=sr_1_7?ie=UTF8&qid=1377720224&sr=8-7&keywords=tablet+stand
Also, don't forget AnyTone makes the QDM-01 Desktop microphone for the AT-588UV also ...

Yep, just turn it around. Personally, since I have some carpentry skills after a wild summer of redoing a bathroom and kitchen here, I'd just build a wedge out of some 1/4 ply. Draw out a triangle for the sides for the length of the radio on top, the bottom will be slightly longer and the front however long you want to produce the angle. Transfer the image to the plywood x 2 and cut it out. Then a top bottom and front and eyeball it up. Use some Elmers wood glue and a few brad nails to hold it together while the glue drive overnight and for under an hour's time you have a stand. You could even bolt your mobile bracket upside down to the stand to hold the radio in place.

Subject: [Anytone_AT-588UV] Re: Desk mount for AT-588UV?

Someone had mentioned to me they used a "Tablet Stand" for such a situation ...
Probably something like this one sold by Amazon for $5.99 would do the trick....
http://www.amazon.com/Universal-Adjustable-Blackberry-Playbook-Cosmos/dp/B00523M4RC/ref=sr_1_7?ie=UTF8&qid=1377720224&sr=8-7&keywords=tablet+stand
Also, don't forget AnyTone makes the QDM-01 Desktop microphone for the AT-588UV also ...

What I did was for when I have my on my radio desk was I mounted the chassis of the radio to the side of my desk located close to my power supply and then ran the head cord to where I wanted, and used a 2nd head mount that I purchased. This lets you move it up and down for best viewing. works for me.

When I had a Yaesu FT-7900 I used the remote kit to mount the
control head on top of the monitor shelf on my computer desk.
Plenty high enough to see the display well. An older Kenwood
mobile I just mounted the whole radio under the monitor shelf
since there was no remote option. And you don't need a remote
bracket for the 5888UV, just unbolt the bracket from the radio
body that the control head snaps into and screw it down to a shelf
if your desk has one.

I've modified some computer monitor arms and even panavises to hold a shelf to mount the radio with the mobile bracket or to sit on for some clients. I've also installed wall shelving with standard and bracket in my own shack for additional gear for such things as speakers, scopes, VHF/UHF radios, meters, tuners, power supplies, etc. I had 3/4" glass with beveled and polished edges. If you want the radio at eye level, wall shelves come in a variety of types and pricing. You can get away inexpensively or really aesthetically pleasant. Since selling my home, I stay with friends and have the mobile mount installed on the bottom of radio, so the front of the radio cants upward. It sits on the desktop, but with some Baofeng spare battery boxes under the bracket, and that gives it just enough height for the antenna connector to clear the desktop. One other suggestion is to go to your local home center. They have closet and garage
organizers. There are some relatively useful open cabinets with shelves. You can just sit it on top of your desk to gain more space for radios, or attach it to the wall

Any suggestions for a desk mount for my AT-588UV?

When it's flat on the desk, I can't read the display. Something that raises the front up at a 45° angle would work. So would a suction cup stand with an adjustable arm.

Searches yield large numbers of mounts but they're made for smart phones, tablets, or large monitors and it's not clear which if any would work.

Anyone have something that you're happy with?

Thanks,
Irv W4IWK

The object is to use an adapter cord, instead of the factory supplied microphone, through an NAT AA34-300 audio conditioner. This will allow the air crew's headsets to transmit on the Anytone through the helicopter's existing audio system without having to use the factory external mic. I have accomplished this using Motorola, ICOM, and several other brands of non-aviation radios. My problem is that I can get the Anytone to key but no matter what I try, I am unable to achieve transmit audio. All I have is carrier wave. The factory schematic shows #2 pin PTT (push to talk), #3 mic audio high, #4 mic ground. The existing multi-band radio worked absolutely fine using those 3 inputs. The Anytone does not.

2180. microphone hook

Yahoo group: Anytone_AT-588UV
Date: 2013-08-29 06:31:29 UTC
From: <w3pcj@...>
Topic: 2180 Message: 2180

Does anyone know where I can get a microphone hook for my radio? My last mobile radio was a Kenwood and the mic hook for that one will not work with this one. I was surprised that a mic hook was not included, but I am not complaining as I know the price was right for the radio.

Thank you in advance.

2181. cant get on the air band

I think the number is around 5 but it's not constant with every radio.
I own two radios, one is one of the first 19 to roll off the assembly line.
The other is #287. Both have some oddities, anomalies, bugs, whatever you
like to call them but the #287 radio only has one annoyance and that is
receiving a signal on either side of the radio in the 155.xxx MHZ range.
If that side is not the Main side as soon as I start rolling in my SUV, I hear
some crackling noise when the vehicle is in motion and when someone
is talking on that frequency. Now if you switch that frequency to be the Main
side of the radio, left or right it doesn't matter, the crackling goes away.
One other annoyance is that if you side is scanning, and the other side is
receiving on any VHF frequency, as the scanning side goes past a UHF
channel, the VHF channel that is receiving a signal make a slight pop.

The #19 radio is a little worse and really needs a firmware upgrade but
I don't often scan on it and its used as a base station and frequently as a
cross band repeater where it really shines. I cross band into a VHF repeater
that I'm on the fringe of using a HT. I have to stand in some hot spots
and have no problem getting in. But no such luck sitting in my easy chair
or downstairs in my shop. So the cross band is handy and reports on my audio
when I first set it up were that if I wouldn't have mentioned I was going through
a cross band repeater, nobody would have know because my audio sounded
as good or even better than the HT.

So yes the radio does have its share of annoyances but they can be worked around.
And my #19 radio is in cross band mode all day long for the past 8 months.

I've got a box of those brand spankin new from the old CB craze days. The truck drivers would
eat them things up. Most radios came with the flimsy two finger type that bolted only on the bottom.

Make the Left side the Main side. Press the V/M to go into the VFO or frequency mode (forget what the Chinese call it. Anyway once you are in the VFO mode and the left side is the Main side, press and hold the left channel selector in to go through the 1xx.xxx, 2xx.xxx, 3xx.xxx, and 4xx.xxx bands. Once in the 1xx.xxx band you can tune from 108 - 180 MHZ. Press the channel knob on the left side again for 1/2 second and then turn the channel knob. You will notice now it tunes in one MHZ steps. I just tried this and my instructions are accurate. If you follow these instruction you should be able to access the aircraft band. If not, look at the Anytone sticker on you box where it gives frequency range. If it does not say 136 - 179 MHZ 400 - 490 MHZ it may be an export model in which case there is a
program that can restore it to the frequencies above. I'm not sure if the export model could cover 108 - 136 the aircraft band but if your radio can't that may be the reason. Please let me know what you find.

Topic: 2194 Message: 2194

In just about 10 short mins. after hooking up my new AT-5888uv the honey-moon with this radio was over. The receiver is horrible, no matter what ham repeater I programed into the radio the result was the same, pager intermod was non-stop! The radio is said to be from the latest production run, with the latest firmware, I don't know how to check that claim. I'm using it as a base radio and never had any intermod problems with any of my other radios at this location. Any ideas? Before I return it for a refund.

I use my 588UV which was the 19th official unit after prototype, on a Cushcraft AR270B dual band vertical the tip of the antenna is at about 40 feet. Gain is 5.5/7.5 dB VHF/UHF respectively. I've never heard intermod distortion or adjacent channel interference. I've also used my second AT588UV on the same antenna. This radio was #287 off the production line and it has no intermod or adjacent problems. And both radios are capable of working a VHF repeater that is 110 miles away in a straight line. What I think you have is a defective radio and you need to contact your seller for a replacement or refund.

Miton,
Our latest shipment of new AT-5888UV's, just arrived last week, all have their included microphone with the "steel Loop" hanger at the top, as you mention, not a round button on back, so the handy hook will work.
We also have received 5888's in the past with the button & no steel loop, so they seem to be producing them both ways, or have switched to the hanger loop on the newest models .....
People planning to order mic holders should double check exactly which they have before ordering anything based on another user's experience or reccomendation....

Wrong!! Being a "commercial LMR" I would think group/zone programming would be an important feature, most commercial radios offer that ie: Kenwood, Motorola, BK, etc..It's a very important feature in the fire service, I would say that is a big drawback and deal breaker on the 5888UV.

Thanks for the info. I did turn off the RF Squelch and adjusted some other settings but nothing helped. I have shipped the radio back to the seller for a refund. I might try another Anytone later when they work-out all the bugs, but for now the Anytone gets a big thumbs down! I'll go back to my trusty Yaesu!

My FT8900 is sitting unused on my desk in favor of the AT-5888UV. I have another AT588UV in my SUV. The Yaesu was hard to operate in subdued lighting do to the fact the panel buttons aren't backlit. I think you had a defective radio. I hear very few complain about intermod.

RF squelch turns off portions of the receiver while carrier squelch
does the same but in the audio portion of the radio. So when using
RF squelch you will see nothing on the signal meter until the signal
is sufficient to break the setting whereas with carrier squelch you will
see signal meter activity and when the carrier is strong enough it
will un-mute the audio.

2211. RPS-AT5888UV programming software by RT Systems

Yahoo group: Anytone_AT-588UV
Date: 2013-08-31 21:37:04 UTC
From: <sp7xft@...>
Topic: 2211 Message: 2211

Does anyone use RPS-AT5888UV programming software made by RT Systems? Looking at RT Systems web page I found the following information regarding this software: "Works only with the RT Systems USB-A5R cable." I already have a cable which is working fine with factory software (as well as with other software to program Yaesu, ICOM or Motorola) and I wonder if my cable would also work with RPS-AT5888UV? Have RT Systems put "some tricks" to the soft which verify "the right cable" (i.e. sold by RT Systems)? Or it is just a marketing to sell not only software but also hardware? Does anyone has any experience in this area ?

Regards,

Paul

John, it's not the cable that causes the ports to jump around. It's if you plug the cable into a different USB port. When you plug the cable first time into a port, the cable's unique ID and the USB port it'd plugged into ID are both recorded into Windows registry. This is so the cable will have a high likeliness of keeping the same COM port and settings. Or setting for any other equipment plugged into the port. When you plug the cable into a different port the operating system considers it a new device if the connection has not been written to the registry. Now, if you've been plugging other things into USB that get a COM port and have several different USB ports all associated with different COM ports, the operating system will search for available COM ports... the ports that are not already in use as defined not what's actually plugged in, but rather what's recorded into the registry. Since there is no way other than you own brain to tell you which port is actually in use, I just choose one that's already in use according to Windows and tell the Windows just to use that connection anyway. Most of the time you will find COM 1 used by the computer so that's the one to stay away from. I have a cable checker that searches each COM port for a device. If the COM port is usable even if Windows says it's already in use the cable checker will com back and say Invalid COM port. That means there is no device of any kind using the COM port listed in the program. So that is the best was to handle COM port confusion. I can get the cable checker program and upload it tot the group. That will tell you what ports are actually in use and what ports are just a ghost written in the registry. Those like I said can be forced to be used, Windows will overwrite the enumeration IDs in the registry.

Some software applications like Chirp and QPS-AT588UV (the bundled software) will only work if they see a cable driver they like. So yes it is likely that RT Systems has engineered its software
to only work with their cable. This not only increases their sales but decreases their need to support
technical issues of no RTS cables.

I bought RTS for one of my several Yaesu mobiles that have come and gone
in the past, and my VX5 triband HT. Serial ports were still in real use back then
so the cables were DB9 on one end. And the software came on one 1.44 floppy.
Now I use a real old Radioshack USB to serial cable and plug the Yaesu cables
into that, DB9 - DB9. Works ok but in Windows 7 I'm using a Windows 2000
driver for the Radioshack cable. It was the last driver they wrote and I'm lucky
I could get Windows 7 to work with it. Any COM port in a storm I guess LOL.

I use the RT systems software and cable for my Anytone mobile. I love it.

I also got the ARRL disk being offered by RT Systems and could layout a

travel path from LA to Springfield with all the repeaters along the way

and load them into memory on the Anytone in just a few minutes. I made the

trip with a radio that I could use to track across the country and have repeaters

available all along the way. Great experience.

Could not do that with my Yaesu or commercial radios. Well worth the price and works

terrifically. Great reception even out in the middle of Oklahoma and the Ozarks.

Took the software with my Win8 notebook and could change the program along the

way as desired.

The RT options work wonders with the radio and cover the Part 90 parts for my

public service work. I highly recommend it.

My 2 bits. Have a great day and thanks to Milton for all the hard work he does on

this group.

2219. RE: AT 5888UV MIC SCHEMATIC AND PINOUT

Yahoo group: Anytone_AT-588UV
Date: 2013-09-01 21:43:54 UTC
From: <acousticarp@...>
Topic: 2140 Message: 2219

As stated in my first post, I am looking for a way to connect a helmet headset (ATV) to my AT5999. Not being able to find a schematic, I bought the QHM 02 hand mic without DTMF pad to cannibalize.

There is a single circuit board inside with a condenser mic, resistors, a capacitor, three momentary switches (PTT, up, down) and a slide switch to disable the up down switches. No sign of an IC chip or transistor for a mic preamp, confirming what Milton wrote about the preamp being inside the control head.

DC voltage to bias the condenser mic is not superimposed on the mic audio conductors as is done with phantom powered professional mics. It comes from pin 7 (+5VDC). Transmit audio goes dead with pin 7 is lifted.

Although there is no speaker in the QHM-02, there is receive audio across some of the pins when checking with an earphone with a DC isolating capacitor. It was so low in level that it was unusable. I suspect the full featured hand mic (QHM-04) has an amplifier to power its speaker.

I decided to obtain receive audio from the speaker output jack. Rather than have an additional cable to carry the receive audio I stole two of the eight conductors in the curly cord. My PTT switch will be on the handlebars so I don’t a PTT switch at the helmet, freeing up pin 2. The QHM 02 has no keypad so pin 8 is likewise free for the receive audio.

The QHM-02 is attached to the helmet with Velcro. I disconnected the QHM 02 internal mic element and connected the helmet headset mic in its place. The helmet earphones are connected to pins 2 and 8 which now carry audio. They are intercepted at the radio end of the curly cord with a male RJ45 and female RJ45 where the receive audio is connected to them. The up and down switches continue to function as before.

A schematic of the radio or the QHM 04 hand mic might reveal a better way to do this but for now, the above works.

--- In anytone_at-588uv@yahoogroups.com, <mhywattt@...> wrote:

I have a schematic and block diagram for the AT-588 but that is a different radio being UHF only. Someone sent it to me thinking it was for the AT-588U/V.

There is a pinout of the speakermic in the user's manual at the end of chapter 4 Getting Acquainted. But there is no connection for the speaker given. Only thing I can guess is that audio floats into the mic on the key pad serial data pin 8. All the communications from the radio to the control head are on the serial data line between the radio and the control head. So it wouldn't surprise me if it also sent digital audio data to the speakermic where it went through digital to analog conversion inside the speakermic. That probably accounts for to extreme amount of digital noise from the speaker in the speakermic.

So the only way to get headphone audio would be to use a stereo to mono adaptor for the 3.5 mm jack in the back of the radio. Otherwise you will just get audio in the left earpiece.
And unless you can make a lowpass filter to put in line you will not be happy with the audio.

Also, the mic preamp board is part of the RJ45 8P8C connector for the microphone and is located inside the control head.

I've been helping a list member off list with his AT588UV and a NAT audio conditioner for a
radio that would interface the radio and it's receive audio into a Robinson R44 helicopter. The
Yaesu Ft8800 he removed worked ok but we cannot get the AT588UV to modulate. So we both
know the audio requirements for the AT588UV like the noses on our face. On the audio line
into the AT588UV there is about 1.3 millivolts on transmit. So it doesn't require a bias voltage
of 5 volts. In fact DC voltage is blocked before the mic audio signal gets to a dual op-amp on the
RJ45 board in the remote head probably with a .0053 cap. So even if you had 5 volts on pin 3 of
the mic, it woud be blocked before entering te first op amp. I've confirmed this both visually and
electrically. We still cannot get audio from the headsets into the AT588UV and the only problem
is Rob is in Florida and I'm in NE Ohio. Otherwise I'd borrow a General Dynamics R8000 test set
from a radio shop I do a little work on non-commercial equipment, set inside the helicopter and see
where the signal is stopping. It's not very complicated but without test gear and following the audio
signal, it's hard to trace down. So I understand exactly what your steps were to get your system to
work. And since the AT588UV input is medium impedance you can use a good old dynamic mic
element of 600 ohms or more and get good results.

Subject: [Anytone_AT-588UV] RE: AT 5888UV MIC SCHEMATIC AND PINOUT

As stated in my first post, I am looking for a way to
connect a helmet headset (ATV) to my AT5999. Not being able to find a schematic, I bought
the QHM 02 hand mic without
DTMF pad to cannibalize.
There is a single circuit board inside with a condenser
mic, resistors, a capacitor, three momentary switches (PTT, up, down) and a
slide switch to disable the up down switches.
No sign of an IC chip or transistor for a mic preamp, confirming what
Milton wrote about the preamp being inside the control head.

DC voltage to bias the condenser mic is not superimposed
on the mic audio conductors as is done with phantom powered professional mics. It comes
from pin 7 (+5VDC). Transmit audio goes dead with pin 7 is
lifted.

Although there is no speaker in the QHM-02, there is
receive audio across some of the pins when checking with an earphone with a DC
isolating capacitor. It was so low in
level that it was unusable. I suspect
the full featured hand mic (QHM-04) has an amplifier to power its speaker.

I decided to obtain receive audio from the speaker output
jack. Rather than have an additional
cable to carry the receive audio I stole two of the eight conductors in the
curly cord. My PTT switch will be on the
handlebars so I don’t a PTT switch at the helmet, freeing up pin 2. The QHM 02 has no
keypad so pin 8 is likewise
free for the receive audio.

The QHM-02 is attached to the helmet with Velcro. I disconnected the QHM 02 internal mic
element and connected the helmet headset mic in its place. The helmet earphones are
connected to pins 2
and 8 which now carry audio. They are intercepted at the radio end of the curly cord with
a male RJ45 and female RJ45 where the receive audio is connected to them. The up and
down switches continue to function as before.

A schematic of the radio or the QHM 04 hand mic might reveal
a better way to do this but for now, the above works.

--- In anytone_at-588uv@yahoogroups.com, <mhywattt@...> wrote:

I have a schematic and block diagram for the AT-588 but that is a different
radio being UHF only. Someone sent it to me thinking it was for the AT-588U/V.

There is a pinout of the speakermic in the user's manual at the end of chapter
4 Getting Acquainted. But there is no connection for the speaker given. Only thing I
can guess is that audio floats into the mic on the key pad serial data pin 8.
All the communications from the radio to the control head are on the serial data
line between the radio and the control head. So it wouldn't surprise me if it also
sent digital audio data to the speakermic where it went through digital to analog
conversion inside the speakermic. That probably accounts for to extreme amount
of digital noise from the speaker in the speakermic.

So the only way to get headphone audio would be to use a stereo to mono adaptor for the
3.5 mm jack in the back of the radio. Otherwise you will just get audio in the left
earpiece.
And unless you can make a lowpass filter to put in line you will not be happy with
the audio.

Also, the mic preamp board is part of the RJ45 8P8C connector for the microphone and is
located inside the control head.

I hooked my AT-588UV up in my jeep and all is good. I made up another power cable for my truck direct to the battery so I can run the radio between the two. In the truck, a 1995 Dodge with a 5.9 gas engine I am getting an alternator whine and possibly some ignition popping sounds. Can anyone recommend what what kind of a filter I can use to cut some of the noise.

Also, what is the reasoning behind putting a fuse on both the positive and negative leads at the battery? The stock power cable came that way so I did the same on the second cable I made up.

Radio Shack sells (still, maybe) a large feedthrough capacitor which mounts on the car chassis and connects inline to the alternator plus lead. It worked for me on past radios and may work for you in eliminating the whine. You might want to try it on the positive lead to the radio first to see if both the whine and ignition noise can be eliminated. Also, consider resistor spark plugs to eliminate ignition noise. If the ignition noise persists after all this, there is always shielded ignition wires. Since you are made of money, that shouldn't be a problem... God luck.

I get a little whine in mine but barely perceivable. As far as fuses go, you need to have two fuses inside the engine compartment. If the + wire shorts where it feeds through to the inside the fuse blows instead of the wires burning up. Fusing the negative is debatable but I've always done it anyway.

Good information Milton. Thanks for posting.
I suspect the reason our observations are different might be because I am working with QHM-02 and you have a QHM-04. I cannot measure any DC voltage across the mic pins (3 and 4) when transmitting.. The transmit audio does die out similar to a capacitor discharging when I disconnect pin 7.

I am new to Yahoo! groups. Can you send me a private message with your email address? I would like to send you a schematic of what I ended up doing.

The negative lead is fused to protect the radio in case the battery ground lead gets lifted off of the car chassis and you try to start your car. Without the negative fuse, the high starter current would try to flow through your radio and the antenna shield wire, smoking the lead and your radio in the process. The chances of that happening seem pretty remote but I guess the fuse is a good idea.

Perfectly good alternators can superimpose a whine on DC to your radio.
It's pretty easy to filter, you can google how to make a filter.

That is a driver issue. I had this exact problem. Here is where I found what the 8020 means.

c) "Run-time error 8020: Error reading from comm device."
Error occurs if Prolific driver version is higher than v3.2.0.0
You must Downgrade to v3.2.0.0

Go to this site. http://www.miklor.com/COM/UV_Drivers.php#install

then follow the instructions on how to install the version 3.2.0.0 cord driver.

just make sure to use the same usb port each time with the cord as if you use other ports on the computer you will have the same issue and will have to install the driver for the new port. hope this helps.

John,

I use the program and cable that came with the radio. It does take some time to work with it but you will catch on fast.

Some simple things to remember, unlike most ham radios you do not put in the - or + offsets. You will need to type in the receive and transmit frequencies. Also for the ham band keep it as a wide band to make most of the repeaters happy.

Personally I like the software, but I am still learning.

Paul

Hi,

I still can't get the Anytone software to connect, but by using an older Prolific driver I could get Chirp to connect. I programmed it with Chirp, but I can't seem to receive. People say they can hear me , but I can't hear them although I can hear on a couple of channels. Must be something to do with my repeater settings.

Your programming cable isn't installed properly, the radio
does not have to be in any special mode. Start by going into
the hardware manager of Windows and look for the Prolific
driver somewhere towards the bottom of the hardware tree.
click on it to expand its properties and the find out what COM
port it's on. Then reference that COM port in the Anytone Software
and / or Chirp. Should work ok after that.

Maybe you need help here - http://www.miklor.com/COM/UV_Drivers.php
Prolific cables are pretty much interchangeable driver-wise within other
brands of radios. I took a Prolific cable for my AT588UV and turned it
into a cable for my Yaesu FT8900. Took a Baofeng cable and turned it into
a cable for my FT60 and then with a home made adaptor, to use on my Alinco
DX-SR8/T HF rig. This is simple COM port serial technology, almost as old
as cave men. The new part is the USB to COM port UART chip. And it is on that
end where most people have problems in Windows especially Windows 7 that
likes to go out to Microsoft's file depository and install the newest drivers. Some
of these Prolific based cables have a counterfeit USB to COM chip and if a driver
with a build newer than 3.2.0.0 is used, the driver was written to detect counterfeits
and won't work. Both Chirp and the Anytone software can be sensitive to the driver
build and actually crash and do odd things. But the 3.2.0.0 build seems to be preferable
if you are having problems. I lucked out and got 4 cables all with the real Prolific chip.
So go to miklor.com, the like I posted above and do some reading and download that
driver if you haven't already done so.

I initially had some problems with the programming software, but once I found the right Prolific driver, no problems. However, I'm still having strange issues. In order to transmit and receive I have to set both sides to the same channel. It will tx on the main band but only receive on the sub band. If I have the sub band on a different channel it doesn't receive at all. Sometimes it won't transmit at all, just tx for a second then gives 5 quick beeps. I reset the radio to factory and still have the same issues. Just trying simplex right now, but had same issue with repeater set up. I have tried two different antennas. Tried two different power sources. Starting to think I got a bad unit. Anyone else have these kinds of issues ?

If you reset the radio the possibility exist that the radio
has some issues and you might want to contact the person
you bought it from for an exchange. I've seen these radios
do some odd things but not being able to receive and transmit
on the Main band is more of a problem with the rig. Of course
it will only transmit on the Main band but it should receive
there too. Do you get any indication on the signal strength meter
that it is receiving on the Main band ? Or does it not indicate?
Make sure you don't use RF Squelch. When the radio beeps when
trying to transmit are you sure the radio is getting a good DC voltage
and current from the source? I had one radio that had transmit problems
but didn't beep, it would just power of on cycle. Found that the fuse
on the radio side of the cable was bad. Take all three fuses out of the plastic
and pull on the ends. If the entire end cap pops off you have a bad fuse.

Make sure your antenna is good, good SWR.
 So make sure you only use Carrier Squelch.
Not sure what all you've tried but you can also try using Carrier Squelch only,
PL tones to off or just encode, and open the squelch be setting it to 0
to see if you can receive on the Main band. If you've tried all this and still
cannot receive on the Main band I'd say the radio is defective and should be exchanged.
Oh and did the radio ever work right?

I would think with a bad or intermittent serial data connection
or 5+ volts, the radio would operate extremely screwed up if at all.
But still with every bit of data, every encoder and potentiometer change,
every button push being transfered to the main radio via serial ports data,
It is possible that the data transfer from control head to radio body is getting
corrupted along the line somewhere. Between the control head and radio lies
serial port style data transfer. Probably at 19.2K or 34.8K rather than 9600 baud.
But it'd the same style as the old COM ports used for an external modem and stuff.
And everything travels serial data except the microphone voice output.

Anyways if you've gone through all out suggestions without a solution, send the radio
back for a refund or exchange. If you bought it from Ed Griffin tell him you had
dialog with me and it pointed to the radio being defective.

rodge,

this is where i got mine http://www.associatedradio.com/home.php

they answered all my questions promptly,it was shipped quickly and packaged safely.I ordered mine on 8/28/2013 the build date listed by the programming software was 07/09/2013.so at the time i ordered it was the most current build not a prototype that had a firmware upgrade.if i buy another one it will be from them.right now they are $299.99 + shipping and i think he throws in programming cable and seperaton cable.

thanks

I just bought mine from Austin Amateur Radio Supply. They are a local shop. Mine was good out of the box. They include software, programming cable, and head separation cable.

I've dealt with them ever since I got involved in amateur radio and while their prices aren't always the best, I don't have to pay shipping.

In this case, they're selling it for about the same as everyone else ($299).

(The only interest I have in this store is that they stay open so I have a local radio shop.)

I too read the article this morning.I have had my radio for a little over a month now and I love it.For a budget radio mine does everything I need it to do and then some. There are a couple little quirks but nothing I can't deal with.I had mine programmed and on the air in less than 30 min.I think the biggest issue with programming and cables is the counterfeit chips,which by the way is not a radio issue.I believe if there were more decent quality budget radios there would be more people getting into Ham radio,that was a big drawback for me for a while was equipment cost.So far I have not had any problems with my Anytone and will probably buy another later down the road.

After going to get my mail today I seen this months ARRL QST magazine. Was like oh more reading material. Then I noticed on the front cover Anytone AT-5888UV. Thought oh this will be great reading.
After flipping to page 58 I start reading. 3 pages later the moral of the story was that the 5888uv got the bad hand of the handshake review.

I'm glad I bought this radio before I subscribed to this mailing list and before I read that review.

I've seen complaints here of odd behavior, and that review combined with those complaints would have steered me away. I'll probably buy another one later this year too.

If fact, the only features I find myself wishing it had are scan groups and the ability to display freq on one side, and chan name on the other. But those are not a major thing for me.

Yeah I'd like my radio to fetch my slippers, hand me my smoking jacket and pipe, pour me a glass of brandy and fetch the mail and newspaper. But it has some limitations. Most of the 640 some members of this group have positive views. A few, negative, and some say nothing. Even a few praise it. I will say that my two radios work. One really early off the production line could use a firmware upgrade but when used as a base radio any quirks are not an issue. Even though I have a high gain Cushcraft 2/70 B Ringo with the base of the antenna at 35 feet, Belden 9913 coax, and nearly a flat match across the ham bands I get no intermod or adjacent channel interference. The RX audio could be a little cleaner out of the built in speaker but a good external communications speakers takes care of it. And if you turn the volume up the distortion goes away. Again not a deal breaker for someone looking for an economical business band or radio that will work on amateur frequencies.

What goes through my mind is I don't believe it states where they got the radio from?
Some may ask what does that matter? but from what I have been reading over the past months it does matter.
Some suppliers have had lots of problems with their inventory with wrong bands, older firmware etc supplied and only 3 weeks ago Anytone implemented new firmware again.
I am a dealer selling Anytone, I have sold many hundreds of the 5888 and had one unit back only, yes ONE and that was because the guy really could not understand how it operated, it was no fault of the rig.
I have seen so many good comments by users the review kind of annoyed me.
In my opinion it almost seems as though no matter what Chinese radio is reviewed he is stuck on the Icom, Kenwood, Yaesu only syndrome? QST mag is heavily subsidized by advertising, shame the Chinese companies cannot give us something to change that but a Yaesu for $400 you can get almost the same (some say better) in an Anytone for $275
Well that's my 10 cents worth.

The real problem with the Anytone 5888UV along with many other Chinese radios is they are marketed before they work the bugs out of them. The fact that Anytone seems to keep changing its firmware every few weeks is proof that are many problems with these radios. The radio has a horrible intermod prone receiver, at least the one I had did. The radio also suffers from poor receive audio, tone encode/decode issues, external speaker jack problems, just to name a few. At $300 a copy, its hardly a throw away radio but at may levels it preforms like one. By the time Anytone corrects all these issues, the future sales of the AT5888UV may be in doubt as well as the reputation of the company! In a year or two, I might try another AT5888UV, if they are still around. Tell then I'll stick to my trusty proven name brands like Kenwood, Icom and Yaesu. Thats my 2 cents worth.

Corrected Copy.

The real problem with the Anytone 5888UV along with many other Chinese radios is they are marketed before they work the bugs out of them and they are not ready for prime time. The fact that Anytone seems to keep changing its firmware every few weeks is proof that there are many problems with these radios. The radio has a horrible intermod prone receiver, at least the one I had did. The radio also suffers from poor receive audio, tone encode/decode issues, external speaker jack problems, just to name a few. At $300 a copy, its hardly a throw away radio but at many levels it preforms like one. Some dealers are offering the Yaesu FT8800 for $339 after rebate and I've seen the Kenwood TM-V71A on sale for around $365, so the difference in price is not really that much. By the time Anytone corrects all these issues, the future sales of the AT5888UV may be in doubt as well as the reputation of the company! In a year or two, I might try another AT5888UV, if they are still around. Tell then I'll stick to my trusty proven name brands like Kenwood, Icom and Yaesu. Thats my 2 cents worth.

But do the yaetsu or kenwood radios work outside of the ham freqs and on the government/business freqs? I work in law enforcement and an looking at getting one as my agency is on 800mhz and the surrounding areas are on vhf and uhf.

The AT-588UV is not a ham radio. It is a low cost LMR. Very few of the radios had problems with Intermod Rejection, adjacent channel selectivity, spurious response issues. So comparing the AT-588UV to hame gear isn't a fair comparison. The radio is 100% firmware controlled. The updates are to change values in the receiver. If you aren't happy with the radio, sell it and buy a ham radio. I own an FT8900 and it has its fair share of anomalies. I also own two AT-588UV's. One as a base, one in my mobile. The FT8900 is sitting in on the radio bench unused.

If the dealers can update the firmware,why don't the manufacturer allow for the end user to upgrade firmware by offering downloads on line.Especially since they are updating so often.I think it would be a great selling point.

I believe that a special chip programmer is needed to do firmware upgrades on this radio. So unless the end user has the necessary equipment, end user firmware upgrades are not possible. Kenwood offers user upgradeable firmware for some of their radios, few others do.

The device is a special USB dongle and both the firmwares in the control head and the radio body have to be updated.

One thing is you'd have to purchase the firmware cable. It
doesn't update through the programming cable.

Another thing is being a LMR and not a ham radio, firmware
updates are limited to the radio dealer. Just like the software that
can change the radio's frequency range and unlock a stunned radio.
Anytone doesn't want that stuff on the street so to speak. Nor would
they send me any service literature. They know I work part time for
a company that sells and services other Chinese and Kenwood LMR
but they are very afraid of being counterfeited.

I would be willing to pay for hardware to update my radio as well.There are ways they could right the software to only be compatible,readable or usable by the radio being updated,look at the smart phone software and things like the ipads and other computers alot of that firmware can only be read by the device you are updating...just a thought.

Hello from SoCal. Im new to the group and wanted to chime in.

Regarding fw updates, I believe they should be done similar to cell phone updates. Push a download thru an ftp and run a live update while the device is connected.
It sounds like you need a jtag connector to update this radio, thus requiring the user to jeopardize the warranty, hence the need to have the dealer do it.

Perhaps a better solution might be an advanced replacement scenario where a credit card is used and shipping is covered by dealer.

Thanx for the group allowing my first post9st here.

I don't think the device is as complicated as some of the JTAG devices I've seen on the internet. I forget the specific manufacturer but I have seen one on the bench at a radio shop I do some part time work for. It wasn't much different from a USB programming cable but even if my life depended on it I couldn't name it or tell you what type of connector it had or what steps you take other than both the radio MPU and removable control head MPU have to be flashed.

Like I had previously replied to others, you need a source for the
firmware update code or the hardware is useless. So if you can find
a dealer that is willing to share where he purchased the hardware and
share the code with you, it's unrealistic to expect to be able to do this
on your own.

I'm not sure the US radio dealers or even the Chinese dealers keep
a list of bugs that are addressed by firmware revisions. It's not
like software updates where version v1.0.0.2 addresses a list of bugs
over version v.1.0.0.1. Most computer users are very used to this but
it does not exist at least for the Anytone. I had to send several videos
directly to Anytone in China of a early production number AT-5888UV
that exhibited the Main and Sub bands interfering with each other especially
while scanning and the marshall or Main band being left and Sub being right.

So I wouldn't hold any expectations for any dealer to keep a list of updates
and what the updates addressed. Right now as far as I can tell by reading
comments is that most anomalies are radio specific. I don't know if this
is a quality control issue or not. Maybe a parts supplier issue. Not visiting
the factory where assembly of the radio takes place its hard to make that determination.

All I can say is that one day if the sale figures for the radio permit an opening
up of US access to some specific data including service literature, that we owners
will feel a little less alien to the radio.

Hi,

Thanks for the info. The first radio I received was totally unusable. I could not tx and rx on the main band. It would let me transmit on the main band , but the only way to rx on that same freq. was to set the sub band to the same freq. Then I could tx on the main band and receive on the sub band.This was all using simplex with the default radio settings. The dealer was great about letting me exchange it. I haven't gotten the replacement yet, but I'm keeping my fingers crossed. I really want to like this radio.

2290. Re: [Anytone_AT-588UV] Firmware version

Yahoo group: Anytone_AT-588UV
Date: 2013-09-18 03:21:24 UTC
From: Milton Hywatt
Topic: 2285 Message: 2290

Hey that's why I created this group, for you and other owners. I bought 00019 off the first DHL truck to deliver them. It had its woes but wasn't unusable. I made several videos, got them to China and they came up with a firmware change. Not necessarily because of my videos alone but I used one of the best test sets available a General Dynamics R8000 to illustrate these anomalies. I went on to find out how well the radio did as far as as TX and RX sensitivity. I was surprised to hear a slight tone on a signal on VHF around 155 MHZ at -129 dBm. The R8000 stops at the least signal it can produce, -130 dBm. UHF was -127 dBm. So anytime you have that hot of a receiver you have to have rejection circuits for intermod, adjacent, and spurious. Those two specs fell within FCC Part 90 specs so they were good enough for me. Transmit UHF was 38 watts, VHF 54 watts into a non inductive dummy load. transmit deviation fell within the Part 90 mandate for commercial and public safety requirements. But still the radio interfered with itself/ Since the AT5888UV is entirely controlled by its firmware, the only remedy would be their techs to mull over the videos and email they got from me and make minor adjustments to the firmware. This is a "soft pot" tuning of both RX and TX circuits. No screwdriver adjustments inside. So you can see how this goes. The factory knows nothing unless they receive feedback and can reproduce it. Your radio appears to me to have problems beyond firmware settings. That's understandable in even in well honed gear. For example I bought a new Alinco DX-SR8/T HF transceiver. Was using a Kenwood TS-530S for years. I had been using the Alinco for SSB for almost a year before trying AM. Much to my horror the AM modulation sounded horrible to others. Like a D104e cranked up to 100% on a CB. Well I did a little checking and in the first stage of AM modulation I found a MISSING capacitor. Contacted Alinco, they express mailed the part and I installed and it corrected the problem. Sounds excellent all the way around and what a great and simply economy radio that is. So Alinco has been building ham gear since the early 90's. First dual band HT I owned was an Alinco DJ560. I still own it as a matter of fact although it is sitting boxed along with my two Yaesu HTs since I purchased two Wouxun KG-UD6V (ham only) and the new V2. I've got 4 batteries for each radio, speakermic, two desktop chargers, two alkaline or Li-On battery packs and I'd say I'm ready to go. I think highly of these Wouxun hand helds. Anyway sorry to burn your eyes out, I'm a very fast typer around 155 WPM with 90% accuracy so it;s easy for me to carry one like I would in a vocal communication.

Take care;
Milton

Subject: Re: [Anytone_AT-588UV] Firmware version

Hi,

Thanks for the info. The first radio I received was totally
unusable. I could not tx and rx on the main band. It would let me
transmit on the main band , but the only way to rx on that same
freq. was to set the sub band to the same freq. Then I could tx on
the main band and receive on the sub band.This was all using simplex
with the default radio settings. The dealer was great about letting
me exchange it. I haven't gotten the replacement yet, but I'm
keeping my fingers crossed. I really want to like this radio.

2291. QPS588UV Version 1.0.1

Yahoo group: Anytone_AT-588UV
Date: 2013-09-18 15:48:37 UTC
From: <w3pcj@...>
Topic: 2291 Message: 2291

I was trying to help out a friend who just got his radio a few weeks ago program it. As I had all our local ham radio repeaters already programmed into my laptop I thought it would be a simple task to just plug my laptop into his radio. Well it was not that simple. My radio that I got this spring programs great with QPS588UV Version 1.0.0 but his new radio is asking for QPS588UV Version 1.0.1. Does anyone know where I can get QPS588UV Version 1.0.1?

Thank you for your time.

First off, hello to the group. I recently purchased one of these radios. So I was glad to see that there was a Yahoo group for them.

Now to the dumb question... What's a "Hyper Memory Channel"?

2297. Re: Hello and a dumb question

Yahoo group: Anytone_AT-588UV

From: jwheatleyus
Topic: 2296 Message: 2297

Hyper Channels

Hyper Channel 1 gives you two pre-programmed channels that are selected by pressing the Left Volume Knob. Hyper 2 provides two more channels that are selected by pressing the Right Volume Knob. You can also select right or left as the Main channel.

Hyper Channel Setup

In the software go to Hyper1 Chan Edit
Set Mode (s) to Channel
Put desired channel numbers in Left and Right
Set Sub Display to Frequency and Select Left or Right to set the Main Channel
Uncheck all boxes on Right

In the software go to Hyper2 Chan Edit
Set Mode (s) to Channel
Put desired channel numbers in Left and Right
Set Sub Display to Frequency and Select Left or Right to set the Main Channel
Uncheck all boxes on Right

Write to radio

Now press Left Volume Knob for Hyper1 channels or Right Volume Knob for Hyper2 channels.

From: <rpgaun@...>
Topic: 2299 Message: 2299

My radio is on ordered so, before it arrives I wanted to start working on the program. However, I have not been able to open the software. It keeps telling me I need to have the radio attached. So, the question is how can I get the program open with our the radio?

2300. RE: Programing Question

From: <n7kuw@...>
Topic: 2299 Message: 2300

In the folder on your computer where the software is installed, there should be a subfolder called "language", and in that folder should be a file called "mysetup.ini". Open that file using a text editor (such as Notepad) and change the entry "IsFirstRun=1" to "IsFirstRun=0", then save the file.

I would caution you when you do get your radio to read it first and save that file before you write anything to the radio.

That appears to be a windows issue with permissions.
However I would wait until your radio arrives so you
can read from it and try to save the file. If it still gives
you an error, you will want to see where the file is going
to be saved and check that folder's read/write permissions
for the user you are logging in as. If you use Windows 7
you could try running the software in the compatibility
mode and choose 'run as administrator'. It's a bit difficult
to try to help you when I don't know your operating system
or the depth of your skills with that operating system.

The display settings #37 in the menu I believe are independent of the side used to set the menu item. So you could set side A to frequency and B to name. I haven't tried this since my radios both sides are set to name or alpha tag. But it's easy enough to try it.

Mines the same way. Mine is either both sides frequency or both sides alpha-numro named.

Yeah just checked and I was wrong...heh heh...either side you change
the setting affects both sides. Maybe I was thinking of my FT8900 ?
Now I don't know if by software there is a way to usurp the menu setting
in the radio or not. Might give that a whirl. I don't know if this is just
an oversight or if it's how the manufacturer intended the radio to display.

On my radio, Menu 37 changes both sides. Appears there is no way to have Name on one side
and Frequency on the other. Maybe someone with newer firmware will find otherwise.

I'm guessing here but if you have names for some
channels and none for the others the radio would have no choice
but to display the channel number where no alpha exists.
If #37 is set to channel it will display names if they are there.
But I do know by just doing a test that it's not possible to
display the freq on one side and channel or name on the other.
Breaking Bad is on right now so I'm not going to the radio room
to test this out .

Hello,

First off let me thank everyone for all the help this group gives out to each other... I do appreciate it.

I know some LMRs will transmit the mobiles ID number or Unit number to all other radios when the PTT key is pressed. Will the AT-588UV do this?

Thank you for your time on this matter.

Paul

I believe that is covered on page 27 of the manual under DTMF self ID and 5Tone ID.
As far as RX goes there is a squelch mode for "tone" and the manual says it's for carrier + optional
signaling. Note that the Chinese get lost sometimes in the translation so this could possibly mean
by "optional signaling" a DTMF sequence. I'm pretty sure they refer to the 5Tone encoding as optional signaling but I've never experimented with it to know for certain if that mode will open the squelch when it receives a DTMF sequence of tones.

2316. U & L 1-5

Yahoo group: Anytone_AT-588UV
Date: 2013-09-24 15:28:22 UTC
From: <ggutshal@...>
Topic: 2316 Message: 2316

I have a standard set of repeater/frequency programs that I use Chirp to burn into my radios. When I got my Anytone I pushed them into it as well. But when I hit the scan button, it scand not only through my programmed freqs, but also through a set of channels that are shown as U1, L1, U2, L2 ... through U5 & L5. What are these channels? How does one access these and can they be deleted? Are these those "ultra" channels?

2317. Re: U & L 1-5

Yahoo group: Anytone_AT-588UV
Date: 2013-09-24 17:18:15 UTC
From: jwheatleyus
Topic: 2316 Message: 2317

The U and L are called Limit Channels in the software. I have not found a use for them so far. My scan works fine by doing the following:
In Normal Channel Edit double click on the More column and set Scan Skip to P Scan for each channel that you want to scan.
In Function Setup, set Scan Mode to MSM(Pri Scan).
Now it will scan only the selected scan channels.
I set Scan Pause Time to CO which holds on the active channel as long as there is a carrier.

I don't think that is possible. The best the radio can do is PTT ID using DTMF tones for three numerals 000 through 999 I believe. Or 5 Tone DTMF for a total of five numerals 00000 through 99999. Now another AT5888UV on the other end set to decode your tones could possible display either of those codes. I have two AT588UV radios and will experiment with this in the next day once I dispence with some personal issues.

Hmmmm... not heard that one yet. Well until now. I have #19 off the assembly line and it does not do what you describe. Actually there are very few issues I have with the radio as a base unit. I leave it powered on 24 hours a day, now for several months in cross band repeat mode. It never utters a beep, tweet, complaint or anything. I'm sure I have older firmware that you especially if you have sent it back for an update. Don't know what your resolve will be except to contact Ed and see what he says and if there is a more current firmware update for you.

My first inclination is to suspect either the up/down buttons on the mic, or the mic connector (or cord) to the radio. Something is causing the radio to receive/see an "up" command from the microphone. I would disconnect, clean, and reconnect the mic cord, and if that doesn't fix the problem use a contact cleaner and clean the up button on the mic.

Could it be hearing DTMF tones from nearby phone or over the air, that it
is interpreting as a command to change channels/freqs ?
Some radios use DTMF codes for control. (Alinco / Kenwood)
Back around 1990 I had a Kenwood dualband that would hear the dtmf from my
Cellular phone and would change frequencies / bands.

Probably have to consciously set the radio up to respond to signaling
I don't think it is set up by default. I'd try banging or swinging the mic
around to see if it will change channels. That might tell it's in the mic itself if it
does change channels. Also a little shot of De-Oxit wouldn't hurt the mic plug
and jack.

Probably have to consciously set the radio up to respond to signaling
I don't think it is set up by default. I'd try banging or swinging the mic
around to see if it will change channels. That might tell it's in the mic itself if it
does change channels. Also a little shot of De-Oxit wouldn't hurt the mic plug
and jack.

Could it be hearing DTMF tones from nearby phone or over the air, that it is interpreting
as a command to change channels/freqs ?
Some radios use DTMF codes for control. (Alinco / Kenwood)
Back around 1990 I had a Kenwood dualband that would hear the dtmf from my Cellular phone
and would change frequencies / bands.

From: William (Bill) Wallace
Topic: 2324 Message: 2334

The channel change buttons on the microphone are a design misplace. They fall right under your thumb when you hold the mic with your right hand. I found that it was very easy to slide the on/off switch to on (very little pressure to push the slide switch up (on)) and then very little pressure to push the push button one of the up/down switch without even noticing that you are doing it. If you hold the mic with your left hand, the same is sort of true about the placement of your fingers. I put a small piece of tape over the on/off slide switch so it would not move when I used the microphone.

Leave Ed alone he has done a great job for all of us in showing the big manufacture that price is important.

I know this doesn't help very much, but my 2 cents worth;

1) The design is almost exactly the same as the Powerwerx DB750X
2) The design is seemingly a knock-off of the Yaesu FT8800 (as far as menus and features go).
3) There is too much intermodulation to make it a viable receiver for me, as I live line-of-site to a commercial repeater mountain top.
4) The support seems to come from the forums better than the manufacture or distributor.
5) The price, albeit $100-$200 less than the Yeasu models, isn't worth the poor quality and all the design the flaws. In my case, if I can't use the receiver, then it doesn't matter if the rig cost 50 cents!

Thanx a Bunch!

From: <skawa2013@...>
Topic: 2337 Message: 2337

I need some help figuring out the mic pinouts for the AT-5888UV radio. I posted the page from the manual (AT-5888UV Mic Connector) and was hoping that someone could clarify what they mean when they label the drawing "MIC Connector Diagram(in the front view of connector". Is that picture of the jack on the radio looking at it from the outside or is it the plug on the mic curly cord looking at the connector from the tip? I am confused by the term connector.

I found that an issue too. It was a very unwise design to put that
huge button there and no way to lock it out. As far as intermod rejection
goes, not all radios were susceptible to it I took my vehicle up to a location
with 7 towers. Repeaters, POCSAG, I think also LTR and GMRS. I'm sitting
underneath the towers and hear nothing. So it's unfair to say that all these radios
have poor intermod rejection.

I am considering buying an anytone 5888uv.

I will put the control head over the mirror in on the center of the headliner.

2 questions:
Is it possible to run the microphone direct to the main RF unit by passing the control head?
I would like to have a separate large speaker for the audio. Is it possible to turn the microphone speaker off and get audio ONLY from a separate speaker?

Topic: 2343 Message: 2344

Attaching the microphone to the radio body hasn't been
attempted by anyone I know of.

The audio to the microphone can be shut off. And an external
speaker for both sides of the radio is easily obtained with the
speaker and a mono 3.5mm plug.

Subject: [Anytone_AT-588UV] microphone connection point?

I am considering buying an anytone 5888uv.

I will put the control head over the mirror in on the center of the headliner.

2 questions:
Is it possible to run the microphone direct to the main RF unit by passing the control head?
I would like to have a separate large speaker for the audio. Is it possible to turn the microphone speaker off and get audio ONLY from a separate speaker?

I have been monitoring this group for sometime as I am considering buying one of these radios for public safety use. I currently use a Wounux KUV6D and am very happy with it. I keep hearing these chinese radios arent the same a Kenwood or other name brand units.

Are the Wounux units built in the same manner as the Anytone units? If they are, I am sold on getting one as I don't see any issues with them?

Jason. I use ine for both emergency services and amateur. I am very pleased with it so for. Range is decent and I must say, I was a tad bit intimidated by some of the issues I read about here. All in all I would buy another. Good luck

I find the Anytone to be an okay radio, but it does not compare to the higher end commercial land mobile radios available from Motorola, Kenwood, Icom, Thales, etc. If you are happy with the Wouxun, you will probably be happy with the Anytone. If your use is life-safety critical, I would only use a radio furnished by your department or agency.

My biggest dislike is that it is much more subject to intermod when you are in dense RF environments. But if your normal operating areas are not in that type of environment, that shouldn't be a factor.

As with any radio, before using it for business, commercial or public safety you need to coordinate with the license holder for permission to do so. The public safety license specifies all kinds of details including how many radios can be operating on the license, maximum permitted power, etc., and the license holder is responsible for every radio used under that license (regardless of who owns the actual radio).

I also use my radio for both emergency services and amateur radio. A radio that does both worlds and is part 90 capable was a plus in my purchase decision. I've had mine for 3 months now and I love it. In fact, I plan to purchase another here soon for the house.

Thank you for the reply. I work in a rural area outside of death valley, ca. My agency uses 800mhz, however, neighboring agencies are vhf and uhf. My plan is to use this radio for mutual aid situations which aries on occassion. I have been using my hand held Wounux with great results, but it lacks the range for obvious reasons.

As far as intermod.....as I said....we are out in the middle of nowhere!!

I have one AnyTone in my car for Ham and Commercial use and another on a mountain top for XBand repeat in special situations. Both work just fine. They have a few warts (features) like all the new Chinese radios but are fully functional. Having Ham and Commercial in one radio is important to me.

I own two Anytone radios. My Yaesu FT-8900 sits unused on the bench. While they aren't perfect they are 100% functional. Power and transmitted audio are great. Sensitivity is around -127 dB across the radio's coverage. Received audio could be better at very low volume
but hell I'm half deaf and crank the audio up to where passengers in my vehicle have to put their fingers in their ears. Backlighting for the radio and mic is excellent. So when I select a radio to buy or support I weight the good points against the bad. This radio
has much more to offer overall.

Now you've got your input. I'm the group owner and I think it is known by the seasoned members
of this group that I really don't care for comparisons. They are in a grey area where being on topic
for the group purpose is and that is for those who already own the radio, not for prospective buyers.
So let this be the last words on the subject please.

Milton.

From: <ai8o@...>
Topic: 2355 Message: 2355

I'm still thinking of buying an Anytone 5888uv.

I want to mount the control head on the headliner of my truck.
I DO NOT want the microphone or its cable, hanging down from the headliner.

I was thinking that I could possibly use a Kenwood DFK3C microphone extender cord, or a section of Cat5e cable with appropriate connectors,as a microphone extension cable.

I would put one connector end low or below the dashboard, and snake the cable behind the pillars and above the headliner to the microphone connector on the control head.

The questions I need to answer are:

1) what kind of connector does the microphone use?

2) what kind of connector does the control head microphone connection use?

3) what kind of cable can I use between the two?

4) does Anytone, or an after market supplier, make a ready made remote connection assembly ?

The microphone needs a female 8P8C on the mic end and a male 8P8C on the radio end.

The control head needs a standard CAT5 jumper cable.

To get the female on one end of the mic cable you can use a standard CAT5 cable and but a female to female adaptor on one end.

You can extend the mic with a standard ethernet type, 8 conductor cable. But you would want to test whatever cable you plan to use before you actually do the install to make sure you don't introduce any problems. Potential problem areas include audio interference and/or serial data corruption.

The mic output level is very low, in the -40 to -60 neighborhood, making the mic leads susceptible to hum, ignition noise, and RFI. I recommend using shielded CAT5, CAT5e, or CAT6 cable being sure to ground the shield at the radio end.

That is ok if you have a source for shielded cable that will sell it to you in random lengths.
Or you could run a separate two conductor shielded cable just for the mic and mic ground.
Hardest part would be working with the cable(s) and connectors. Working with computer networking since 10 base T started to become available for home and business, I have the hardware to strip and crimp 4 6 and 8 ping connectors. I don't know of another way to properly
attach a connector to cable without the right tools.

From: <n2nov@...>
Topic: 2314 Message: 2366

Has any headway been made on how to set up and use the DTMF, 2 tone or 5 tone signalling? I recently tried DTMF signalling at EOT (end of transmission) and can only get it to work if I manually force the DTMF by holding down the PTT first and then hit the UP key on the microphone. My BaoFeng HT does it automatically when PTT is released. Any ideas?

---In anytone_at-588uv@yahoogroups.com, <mhywattt@...> wrote:

I don't think that is possible. The best the radio can do is PTT ID using DTMF tones for three numerals 000 through 999 I believe. Or 5 Tone DTMF for a total of five numerals 00000 through 99999. Now another AT5888UV on the other end set to decode your tones could possible display either of those codes. I have two AT588UV radios and will experiment with this in the next day once I dispence with some personal issues.

I believe that is covered on page 27 of the manual under DTMF self ID and 5Tone ID.
As far as RX goes there is a squelch mode for "tone" and the manual says it's for carrier + optional
signaling. Note that the Chinese get lost sometimes in the translation so this could possibly mean
by "optional signaling" a DTMF sequence. I'm pretty sure they refer to the 5Tone encoding as optional signaling but I've never experimented with it to know for certain if that mode will open the squelch when it receives a DTMF sequence of tones.

Hello,

First off let me thank everyone for all the help this group gives out to each other... I do appreciate it.

I know some LMRs will transmit the mobiles ID number or Unit number to all other radios when the PTT key is pressed. Will the AT-588UV do this?

Thank you for your time on this matter.

That's the procedure, you have to hit the up arrow to activate 2/5Tone.

Ok, so I looked in the manual but had no luck finding the answer to this --
Can you have one side of the radio scanning while the other side monitors a single channel?

Yes, just push the scan button on whichever side you want in scan mode, the other side stays on its last channel or frequency.

Yes you can scan 1 side and monitor a channel on the other side. But, when i transmit on the side that is monitoring, the scan stops on the scan side. The scan speed is pretty slow, so you would want to keep your scan list to a minimum. And the scan rate is factory set and not user changeable.

If you have a saved image of your wouxun. All you have to do is have the wouxun file open on one tab. Start a new tab and make sure you read from the anytone radio in chirp. Once you have the wouxun file and the anytone file open, all you should have to do is highlight all the channels of the wouxun. Right click on mouse, and click copy, Then click on the anytone tab file, right click on mouse and click paste. The data should copy right over, and when ready send the anytone data to the radio.

If you look at the front panel the SCN buttons are for each side
when the radio is in menu mode one which is the default setting.
So pres SCN on the left and that side will scan when it is main.
Or make the right side Main and press SCN. All the buttons under the display
work on whatever side is main.

Also, I've found that when you do this the radio will lock on the same channel in scan and then you have twice the output (loud). I tried to "fix" this by skipping the channel when in scan, but that doesn't work, it ends up muting the channel after a few seconds (unknown why).

velcro?
fashion a mike hanger hook onto a piece of wire or something and attach to an air vent? use double sided adhesive to stick the mike hook to a spot on your dash. and then if you need to remove later, use an appropriate solvant to get it off.
There are all sorts of different methods here, just be inventive and creative and you'll find a way.
Personally I have never quite understood why people don't like the ring and hook hangers on some mikes...they're easier to use because the mike isn't clamped on to a clip...kenwood, icom and yaesu all have mikes with the ring or some sort of hook arrangement so it's not like it's something unusual.

fashion a mike hanger hook onto a piece of wire or something and attach to an air vent? use double sided adhesive to stick the mike hook to a spot on your dash. and then if you need to remove later, use an appropriate solvant to get it off.
There are all sorts of different methods here, just be inventive and creative and you'll find a way.
Personally I have never quite understood why people don't like the ring and hook hangers on some mikes...they're easier to use because the mike isn't clamped on to a clip...kenwood, icom and yaesu all have mikes with the ring or some sort of hook arrangement so it's not like it's something unusual.

From: Elden Morris
Topic: 2383 Message: 2384

At most CB shops or truck stops, they sell a mic hook that hangs on the rear view mirror. They are only a couple of dollars.

Good luck.

From: Milton Hywatt
Topic: 2377 Message: 2385

With the button hook the mic can only rotate left or right.
And with some button mounts the button locks in and all that
moves is the cord yet is easily removed from the mount.
With a ring and hook the whole mic can flop around like a fish out of water.
That's the difference. I've delt with this back into the CB radio haydays
and all sorts of needs for the pro truck driver. Those guys will let
you know what works and what doesn't and I learned to trust them
on things of this nature.

2387. Has anyone used this for APRS/Packet work, and any updates on COS?

Yahoo group: Anytone_AT-588UV
Date: 2013-10-22 19:20:38 UTC
From: <wnypcrepair@...>
Topic: 2387 Message: 2387

New user to the group, I apologize if these questions have been asked/answered before. I did skim through the conversations and found very little of what I'm looking for, so I'll ask:

1) Has anyone used this radio for packet or APRS work? Performance?

2) There was an earlier thread about the COS line, but I didn't see any real answers, or uploads with info as the OP promised; has anyone figured this out?

3) LONG SHOT - I see the mic has a serial data line for the key pad... has anyone spent the time trying to decode the protocol?

The quick reason for the questions: I'm contemplating buying this radio, but would like to "build-in" an APRS tracker. I have an Arduino Nano that should fit nicely in the head mounting bracket. I figured I can pull power from the USB lines, and have access to the mic port for audio in/out/ptt. I would, however, like the ability to send the "A/B" signal to the body so it switches to the second band prior to transmitting, and back when finished and only if the COS isn't opened. I figured this way I could QSO as long as I want, and have the APRS portion automated during key up.

I'm fairly confident all your goals are reachable with the AT-588UV. But it's not going to be easy. 9600 packet requires some specific audio filtering. You'll have to build the APRS, and come up with COR or COS. All with no schematics. Do yourself a favor and look at a Yaesu FT8800 or FT 8900. The additional money you will spend for the 8800 will be less than what you would spend on a converting an AT-588UV. I hate to tell people not to buy the AT-588UV but in this case I think it's appropriate unless you are an extreme experimenter like I was in my youth.

Milton,

Packet may be an issue then (at 9600 baud), but APRS [at least] still runs 1200 baud AFSK. That should eek it's way through.

I am a tinkerer, and more often than not have more free time than money (not that free time is in abundant supply either). Plus, I like a challenge. The DIY aspect is one of the main reasons I got into Ham radio, so I try to shy away from the plug-and-play approach whenever my capabilities permit :)

As for the Yaesus; yes, I would LOVE to be able to get one of those rigs (I have used all major brands, and am partial to Yaesu above others), but unfortunately, the only source of "disposable" income I have is an Amazon store card with less than $400 in available credit... The good Yaesus' are all $500+ (on Amazon).

So, despite the words of warning & wisdom, I'm afraid I'm forced to walk the trodden path and make due with the Anytone. On the bright side, if I accomplish even some of my goal, it could spur interest in those less inclined to blindly hatchet up their rigs :)

Well that's the spirit! And don't think you are just merely "making due" with the AT-588UV because you are buying a radio that is considered generally a radio that does what it was made to do and that is service the LMR community. I bought 2 radios within a month of each other even though the #19th radio off the assembly line I bought had some serious glitches in scanning with one side stationary or Main and the other side scanning. I do really like the MUTE function. The marshal side of the radio will totally mute the sub side should it become active while the marshal side is active. I was very disappointed with my Yaesu FT8900 mute function that wasn't worth a rat turd. Hardly lowered the volume and not adjustable. So I have 2 AT-588UV's and the FT8900 is packed away in my drawer of former radios. Good luck with your experiments and keep us up to day.

most dual band style antennas are pretty much the same as far as performance goes.
they all have the standard 3DB give or take gain ratings.
it comes down to build quality and minor feature differences between the various styles.
However, if you want a low profile short antenna, a quarter wave dual band antenna will work, but has no gain factor. A typical half wave over 5/8's wave dual band antenna will probably work the best giving you a couple db of gain on each band.
MFJ, diamond, commet and others vary mostly in their price and not much else.
I would recommend NMO style mounts for their robustness though. Some of the cheaper antennas use a reverse pl259 connecter, or a quarter inch stub connection. the nmo is tough and is far less likely to break off or become loose over time.

Regards
Colin

Allow me to kindly disagree with your mount suggestion.
Although in 15 some years I've not had a problem with
an NMO mount and a Diamond dual band antenna even
after twisting one antenna into a pretzel when I forgot to
remove it when I entered a garage. But if you hold up the
UHF and NMO mounts side by side you should be able to
tell which is most sturdy. This was brought to my attention
by one of the sales people at AES and if you look at his van
it has about 14 antennas on it.

However, if you want a low profile short antenna, a
quarter wave dual band antenna will work, but has no gain factor. A
typical half wave over 5/8's wave dual band antenna will probably work the best
giving you a couple db of gain on each band.
MFJ, diamond, commet and others vary mostly in their price
and not much else.
I would recommend NMO style mounts for their robustness
though. Some of the cheaper antennas use a reverse pl259 connecter, or a
quarter inch stub connection. the nmo is tough and is far less likely to
break off or become loose over time.

Mobile - Comet CSB 750
Base - Cushcraft AR270B

I own both and they both work flawlessly for any mode.
I'm sure you'll get a lot of answers for favorites. But the Comet
and Diamond antennas are favorites. And Cushcraft also popular for base
operation.

i have had my Comet CA-2x4SR and nmo mount for about 3 months and love the quality of the antenna as well as its performance.it is a stiffer and heavier duty antenna and you get very little wind whip at 70 mph on the highway,although i wouldn't want to try it with a mag mount.i can hit repeaters all over memphis with 20 watts no problem.

the NMO has a larger surface area of insulator between the center contact and the outer ring.
With a mobile antenna, which is prone to constant strain from wind load, it needs to have allot of material in the mount to insure that it stays solid over the long haul.
The UHF connecter style has a far smaller insulator and the design insures that the constant strain on the bass of the antenna eventually wears that insulator out making the inside of the connecter loose.
Also, with the UHF style connecter, a much longer pin, from the antenna, has to go down into the mount, or vice versa...this pin is wiggled back and forth all the time from the same constant movement of the antenna while mobile. The pin either develops metal fatigue, or reems out the female part of the connecter so that after a while, there is not a firm solid connection between the center pin of the antenna and the center of the mount.
The NMO mount is larger and therefore can take more strain, and will stay solid for allot longer.
The spring loaded center pin of the antenna base insures a solid connection that can move if the antenna experiences allot of strain...but the design of an NMO insures that that part of the mount doesn't move at all.
I have NMO mounts on the magnetic basses on my mobile antennas and never have had an issue.
I've seen other mobile antennas with the UHF mounts become loose and wiggly and you are always having to check your antennas to insure they are tightened down. Once you tighten an NMO mount down with a rubber seal gaskit, it stays there forever.
At the end of the day, both have their pros and cons and it's the classic 6 of one, half a dozen of the other I think.
Many popular ham antenna brands use UHF connecters, so that's probably why the guy from AES has those.

Sorry my apologizes. I know it took a little time to gather
your info and I should have just agreed to disagree. But
I just spent $550 US to fix a gasoline odor coming from
outside the SUV. They replaced the entire pump fixture
which bolts on top of the tank but the pump goes inside.
I watched the mechanic put the pump back on. Reattach
the one in and one out fuel lines and electrics. Jack the tank
back up to position and bolt it on in 30 minutes. I was charged
for 2 hours labor. The owner who is a friend was not there today
but you can bet your arse I will talk to him tomorrow. He charges
me $79 an hour labor and that's what it should have taken.
Not $200 labor.

So I'm a bit pissed off right now, please no need to reply from
anyone and thanks for your concerns otherwise. I'll stay away
untill I've calmed down a bit.

Milton

Anyone run into this on a new radio? I have had the radio for a week. Great radio.
I went to transmit on a local 2M repeater and the radio powered off. Tried again same result. All other memory channels are working properly. I dumped all memory from a 7900 into chirp and then dumped it into the 5888uv. Then pulled all the data to the factory software, saved it, prohibited transmit on the public safety freqs and sent it back to the radio. Only thing I can think of is chirp may have corrupted one memory slot?
After examining the memory by reading the radio I don't see anything out of the ordinary. Its just the one channel doing this.Any ideas?

That happened to me on almost all channels when I was testing. Turned out the power supply I was using was a little underpowered (around 3 watts I think). As soon as I took it out and installed it in the car all channels worked just fine.

One far out thought. The radio will power off if voltage drops below a set threshold. Maybe make sure the 12V is not dropping too low.

If it were more than one channel I would replace the fuse on the radio cable.
My older radio was powering down randomly and when I went to take the fuse
out the end cap just pulled right off. You might want to join the Chirp_Users
list and post you question. One of the programmers will have you do a data dump
and see if anything is astray. Hell you could post the data dump here and I could
look at it. I fugured out a guy's problem with a Baofeng radio. He had the FM broadcast
range set to 70 - 108.1 Chirp say out of bound then bailed. The radio will only tune
to 108. So once he removed that line it worked. So do what you want but a view of the
data dump is going to determine what might be up to the trained eye.

Subject: [Anytone_AT-588UV] Transmit on 1 memory channel powers off the radio

Anyone run into this on a new radio? I have had the radio for a week. Great radio.
I went to transmit on a local 2M repeater and the radio powered off. Tried again same
result. All other memory channels are working properly. I dumped all memory from a 7900
into chirp and then dumped it into the 5888uv. Then pulled all the data to the factory
software, saved it, prohibited transmit on the public safety freqs and sent it back to the
radio. Only thing I can think of is chirp may have corrupted one memory slot?
After examining the memory by reading the radio I don't see anything out of the ordinary.
Its just the one channel doing this.Any ideas?

2407. Speaker Microphone

Does this radio have a speaker in the microphone? And if so, how loud is it?

I want to mount the entire radio under the seat and only have the microphone exposed.

The speaker in my Spkr/Mic is tinny and weak, but it does work. I suggest adding an external good speaker.

Yes it does have a speaker in the microphone.. but that little speaker in the microphone is pretty worthless in a vehicle.. get a good communications external speaker.

If I am willing to give up the DTMF, is there a louder Speaker/Microphone available? I see that Anytone makes one, but don't know if it is any louder than the standard DTMF unit.

My (very limited) experience with external speakers is that while they are certainly better than the speaker/mic, most radios have very little speaker output power, and therefore the external speakers aren't great either.

Does anyone make something that accepts and amplifies the radio speaker output? Ideally, I would like to run it into my car speakers.

My external speaker is loud enough to drive you out of the car- there is plenty of audio power.
Most (all?) auto audio systems have an aux input connector buried under the dash. You can buy adapter cables for connecting your radio to the auto system. Here is a start:
http://www.crutchfield.com/S-DoaZUKu14fU/g_50900/Auxiliary-Input-Adapters.html

Ham shops, cb shops, 2way shops, truck stops, and radio shack all usually have amplified external communications speakers.
If you have a newer vehicle, you may have a 3.5MM input jack on your audio system...simply connect the radio's speaker jack to this with a 3.5MM to 3.5MM cable, but watch the volume level because that jack is meant for line level...nothing bad will happen, but the radio will be allot louder through that jack than your phone or IPod.
Another alternative, is to use a simple IPod/MP3 player FM transmitter unit available at any electronics store. You can connect the FM transmitters 3.5MM plug to the radio and select an unoccupied FM frequency on your car radio to listen to the 2way.
Best buy has an FM unit with a 3ft chord terminating in a 3.5MM plug on it that plugs into the cigarette lighter jack for around 30 bucks. You can select any frequency on the FM broadcast band. The power output of the fm unit isn't enough to go much beyond your car's radio antenna though.
From reports on the list, a regular unamplified external communications speaker is plenty loud with the anytone though.

Regards
Colin

The radio has two watts audio out. Plenty
to drive an external speaker. I use one
in home on the bench, it's a 4" square
speaker that will handle 25 watts but is
plenty sensitive to make 2 watts very loud.
If you have a truck stop around see what they
have. That's where I bought both of mine 10 years
ago.

Not quite understanding you. Are you saying when in memory mode and
you turn the radio off, when you turn it back on it starts in VFO mode?

If this is correct then since it is not covered in the user manual it might
be a setting in the programming software that tells the radio which mode
to start in.

Hi, Everyone,

I'm the guy who wrote the Anytone 5888 review, and I appreciate the comments here. I joined this group and others to do some research on your experiences with the radio, and even asked a question or two.

I noted in the article that many hams like their 5888's, and would consider my review harsh. And you do. I related my experience with one radio. I noted that not everyone had the problems that I did, but that it wasn't hard to find others noting most of those problems. I even uncovered one that your moderator hadn't seen, but was able to duplicate.

I don't know where ARRL got the specific radio I reviewed. They bought it early this year, did their lab work, and sent it to me in April. I don't know if it received updates. They buy the review units the same way you do, anonymously from a dealer, so they don't get anything that's been tweaked just for a review.

The ARRL and dealer now know each other, and I haven't heard about any response from the dealer based on the review. ARRL's policy is to send a review to the manufacturer for comment. I've seen responses included in other reviews I've written, but QST has always included my criticisms, while noting a manufacturer's response if it has a valid counter-argument. If they need a follow-up from me, they ask.

As someone else here noted, $300 is not a throwaway radio, as some of the sub-$50 HTs are.

As for me being an ICOM/Kenwood/Yaesu guy... I'd LOVE to have lower cost alternatives. But they have to work. This one didn't. And as I said, I expect that to change. I expect that the Chinese manufacturers (who are capable of making some superb products) to get it right sooner than later.

On the other hand, do we want all our equipment to come from faceless, nearly nameless, opaque and invisible companies that don't have a true American (or worldwide) presence; that don't come to our hamfests, advertise directly in our media, and communicate directly with us, and have only "generic" websites?

The Japanese companies aren't perfect. They started very much the way the Chinese companies are: domestic products exported through a handful of small dealers in the US, and eventually growing into the world market, with sales and service in many countries. They show up at our hamfests and advertise in our media.

Still, I've heard plenty of complaints that in terms of products and engineering, they sometimes don't listen to their international sales people. That certainly happened with D-STAR. The Japanese engineers didn't understand how we wanted D-STAR to work, and initially dug in their heels and refused to accommodate the kind of networking we wanted. They can be slow to acknowledge and correct design or production defects (but they aren't unique in that). Not everything they introduce is perfect out of the gate. But it's closer. Their products reflect maturity of design, manufacturing and marketing. They're getting better at understanding the wants and needs of their customers.

It's pretty routine for a reviewer and QST to be accused of bias or knuckling to pressure from a big advertiser. My experience is that if I'm critical, it gets printed. At most they'll round off a sharp edge to a comment, but the substance stands. I am an independent reviewer, not an ARRL employee. For the 5888, they printed what I wrote, and actually toned my language down just a bit in spots.

I understand that if you like a radio, and someone comes along and bashes it (especially "officially" with a big audience), you're going to feel defensive. If you know something that moves the discussion forward, by all means let QST, CQ, or whoever published the article know. And let the reviewer know. We're not anonymous! Our email address is published with the review.

What goes through my mind is I don't believe it states where they got the radio from?
Some may ask what does that matter? but from what I have been reading over the past months it does matter.
Some suppliers have had lots of problems with their inventory with wrong bands, older firmware etc supplied and only 3 weeks ago Anytone implemented new firmware again.
I am a dealer selling Anytone, I have sold many hundreds of the 5888 and had one unit back only, yes ONE and that was because the guy really could not understand how it operated, it was no fault of the rig.
I have seen so many good comments by users the review kind of annoyed me.
In my opinion it almost seems as though no matter what Chinese radio is reviewed he is stuck on the Icom, Kenwood, Yaesu only syndrome? QST mag is heavily subsidized by advertising, shame the Chinese companies cannot give us something to change that but a Yaesu for $400 you can get almost the same (some say better) in an Anytone for $275
Well that's my 10 cents worth.

Yeah I'd like my radio to fetch my slippers, hand me my smoking jacket and pipe, pour me a glass of brandy and fetch the mail and newspaper. But it has some limitations. Most of the 640 some members of this group have positive views. A few, negative, and some say nothing. Even a few praise it. I will say that my two radios work. One really early off the production line could use a firmware upgrade but when used as a base radio any quirks are not an issue. Even though I have a high gain Cushcraft 2/70 B Ringo with the base of the antenna at 35 feet, Belden 9913 coax, and nearly a flat match across the ham bands I get no intermod or adjacent channel interference. The RX audio could be a little cleaner out of the built in speaker but a good external communications speakers takes care of it. And if you turn the volume up the distortion goes away. Again not a deal breaker for someone looking for an economical business band or radio that will work on amateur frequencies.

I'm glad I bought this radio before I subscribed to this mailing list and before I read that review.

I've seen complaints here of odd behavior, and that review combined with those complaints would have steered me away. I'll probably buy another one later this year too.

If fact, the only features I find myself wishing it had are scan groups and the ability to display freq on one side, and chan name on the other. But those are not a major thing for me.

2422. Re: [Anytone_AT-588UV] RE: Harsh qst review.

Yahoo group: Anytone_AT-588UV
Date: 2013-10-27 19:36:43 UTC
From: Don Jeerings
Topic: 2258 Message: 2422

I have 3 of the AT-588UV units, All are working excellent. I did have an issue with a crossed wire in one Mic cord, cat IV connector but a phone call to Ed, the dealer, he shipped a (no questions asked) replacement the same day. Two days later, it was in my mail box, and I was on the air.

He didn't even ask for the defective one back, but out of courtesy, I sent it to him for repair (or spare parts).

I have been extremely pleased with these radios.

Note. I discovered that they have an excellent application in locating a repeater jamming station in the area.

You put the repeater frequencies in on both sides of the radio, but select the reverse frequencies on one side.

Now you can see the repeater carrier frequency on one side and the Jamming frequencies on the other side. A hand held directional antenna, out the car window, and with the two separate AT-588UV signal strength indicators, you have it made.

Gary KN4AQ You wrote:

“On the other hand, do we want all our equipment to come from faceless, nearly nameless, opaque and invisible companies that don't have a true American (or worldwide) presence; that don't come to our hamfests, advertise directly in our media, and communicate directly with us, and have only "generic" websites?”

My response is “YES”.

I am more then willing to pay a fair price for equipment, but I am not willing to pay for “A NAME” or the added cost a company must add onto the price of it's equipment to run glossy fill color ads in magazines like QST or CQ. In fact, that is why I no longer get QST... over priced, heavy on the advertisements and slim on content. That is why I have not renewed my ARRL membership for the last 2 years.

I do understand that advertising is crucial to a magazine, as I worked in the media field (TV) for years. I also know you don’t bite the hand that feeds you. So, if something new is on the rise and they don't help pay the bills there fair game.

As it is the AT-588UV is a good little radio and I heard about it by word of mouth. I then took mine to a CERT meeting and 2 friends saw it heard it and each purchased a unit. Both have had there units for a few months now. One of the guys talks to me daily as I'm driving home from work. His radio sounds great and we are all pleased with them and have had no issues with our radios.

This is a new world and social media will bypass whatever negativity you have done to the AT-588UV. Those of us who like our AT-588UV will post about it, blog about it, YouTube about it, tell all our HAM friends about it and the word will get out.

The AT-588UV is a GOOD radio at a GREAT price.

Respectfully,
Paul
W3PCJ

Hi, Everyone,

I'm the guy who wrote the Anytone 5888 review, and I appreciate the comments here. I joined this group and others to do some research on your experiences with the radio, and even asked a question or two.

I noted in the article that many hams like their 5888's, and would consider my review harsh. And you do. I related my experience with one radio. I noted that not everyone had the problems that I did, but that it wasn't hard to find others noting most of those problems. I even uncovered one that your moderator hadn't seen, but was able to duplicate.

I don't know where ARRL got the specific radio I reviewed. They bought it early this year, did their lab work, and sent it to me in April. I don't know if it received updates. They buy the review units the same way you do, anonymously from a dealer, so they don't get anything that's been tweaked just for a review.

The ARRL and dealer now know each other, and I haven't heard about any response from the dealer based on the review. ARRL's policy is to send a review to the manufacturer for comment. I've seen responses included in other reviews I've written, but QST has always included my criticisms, while noting a manufacturer's response if it has a valid counter-argument. If they need a follow-up from me, they ask.

As someone else here noted, $300 is not a throwaway radio, as some of the sub-$50 HTs are.

As for me being an ICOM/Kenwood/Yaesu guy... I'd LOVE to have lower cost alternatives. But they have to work. This one didn't. And as I said, I expect that to change. I expect that the Chinese manufacturers (who are capable of making some superb products) to get it right sooner than later.

On the other hand, do we want all our equipment to come from faceless, nearly nameless, opaque and invisible companies that don't have a true American (or worldwide) presence; that don't come to our hamfests, advertise directly in our media, and communicate directly with us, and have only "generic" websites?

The Japanese companies aren't perfect. They started very much the way the Chinese companies are: domestic products exported through a handful of small dealers in the US, and eventually growing into the world market, with sales and service in many countries. They show up at our hamfests and advertise in our media.

Still, I've heard plenty of complaints that in terms of products and engineering, they sometimes don't listen to their international sales people. That certainly happened with D-STAR. The Japanese engineers didn't understand how we wanted D-STAR to work, and initially dug in their heels and refused to accommodate the kind of networking we wanted. They can be slow to acknowledge and correct design or production defects (but they aren't unique in that). Not everything they introduce is perfect out of the gate. But it's closer. Their products reflect maturity of design, manufacturing and marketing. They're getting better at understanding the wants and needs of their customers.

It's pretty routine for a reviewer and QST to be accused of bias or knuckling to pressure from a big advertiser. My experience is that if I'm critical, it gets printed. At most they'll round off a sharp edge to a comment, but the substance stands. I am an independent reviewer, not an ARRL employee. For the 5888, they printed what I wrote, and actually toned my language down just a bit in spots.

I understand that if you like a radio, and someone comes along and bashes it (especially "officially" with a big audience), you're going to feel defensive. If you know something that moves the discussion forward, by all means let QST, CQ, or whoever published the article know. And let the reviewer know. We're not anonymous! Our email address is published with the review.

2424. Software Programming Question

Yahoo group: Anytone_AT-588UV
Date: 2013-11-03 00:27:29 UTC
From: Brett Ware
Topic: 2424 Message: 2424

A few questions that will help me out A LOT!

Will someone please give the "AT-5888UV for Dummies" Version to my answers.

#1: What are the differences in "Normal Ch / Limit Ch / Hyper1 Ch / Hyper2 Ch"
#2: In function setup please defive the following
-TBST Freq.
-Click Shift
-Key Mode

#3: What is "Communication Note"

Are there any good walk through videos out there for the software?

Thanks!

2425. Re: Software Programming Question

Yahoo group: Anytone_AT-588UV
Date: 2013-11-03 00:51:38 UTC
From: jwheatleyus
Topic: 2424 Message: 2425

1. Normal Chan is where you program desired channels. Limit Chan I have not fully figured out but they are not required for normal use of the radio (I think they are useful in Scanning operation). Hyper Chan can be useful- Instructions at end of post.
2. TBST is Tone Burst. This is the tone used to key some repeaters(usually 1750)- mostly in Europe I believe. CLK is CLOCK Shift- used to reduce or avoid interference. I have never used it. Key Mode- Redefines the Right side push buttons. See Page 7 of the manual.
Comm Note- Looks like a place to store Call sign vs Name- I think it is useless in normal operation.
All of this except for Hyper Chan is in the manual with a little digging.

Hyper Channels

Hyper Channel 1 gives you two pre-programmed channels that are selected by pressing the Left Volume Knob. Hyper 2 provides two more channels that are selected by pressing the Right Volume Knob. You can also select right or left as the Main channel.

Hyper Channel Setup

In the software go to Hyper1 Chan Edit
Set Mode (s) to Channel
Put desired channel numbers in Left and Right
Set Sub Display to Frequency and Select Left or Right to set the Main Channel
Uncheck all boxes on Right

In the software go to Hyper2 Chan Edit
Set Mode (s) to Channel
Put desired channel numbers in Left and Right
Set Sub Display to Frequency and Select Left or Right to set the Main Channel
Uncheck all boxes on Right

Write to radio

Now press Left Volume Knob for Hyper1 channels or Right Volume Knob for Hyper2 channels.

From: Milton Hywatt
Topic: 2424 Message: 2426

I've never set limits for scanning but that is what it does. Set an upper and lower limit an the radio will scan between the two at the specific channels step you've set globally. If I wanted to scan a range I'd use my GRE PSR-600 which scans about 1000 times faster than the AT5888UV.

Subject: [Anytone_AT-588UV] Re: Software Programming Question

1. Normal Chan is where you program desired channels. Limit Chan I have not fully figured out but they are not required for normal use of the radio (I think they are useful in Scanning operation). Hyper Chan can be useful- Instructions at end of post.
2. TBST is Tone Burst. This is the tone used to key some repeaters(usually 1750)- mostly in Europe I believe. CLK is CLOCK Shift- used to reduce or avoid interference. I have never used it. Key Mode- Redefines the Right side push buttons. See Page 7 of the manual.
Comm Note- Looks like a place to store Call sign vs Name- I think it is useless in normal operation.
All of this except for Hyper Chan is in the manual with a little digging.

Hyper Channels

Hyper Channel 1 gives you two pre-programmed channels that are selected by pressing the Left Volume Knob. Hyper 2 provides two more channels that are selected by pressing the Right Volume Knob. You can also select right or left as the Main channel.

Hyper Channel Setup

In the software go to Hyper1 Chan Edit
Set Mode (s) to Channel
Put desired channel numbers in Left and Right
Set Sub Display to Frequency and Select Left or Right to set the Main Channel
Uncheck all boxes on Right

In the software go to Hyper2 Chan Edit
Set Mode (s) to Channel
Put desired channel numbers in Left and Right
Set Sub Display to Frequency and Select Left or Right to set the Main Channel
Uncheck all boxes on Right

Write to radio

Now press Left Volume Knob for Hyper1 channels or Right Volume Knob for Hyper2 channels.

A few questions that will help me out A LOT!

Will someone please give the "AT-5888UV for Dummies" Version to my answers.

#1: What are the differences in "Normal Ch / Limit Ch / Hyper1 Ch / Hyper2 Ch"
#2: In function setup please defive the following
-TBST Freq.
-Click Shift
-Key Mode

#3: What is "Communication Note"

Are there any good walk through videos out there for the software?

Thanks!

2428. Automatic station ID

Yahoo group: Anytone_AT-588UV
Date: 2013-11-05 01:25:13 UTC
From: Brett Ware
Topic: 2428 Message: 2428

Does this radio do automatic station identification? If so, how do I set it through the software.

Warm regards!

No auto ID- this seem to be a weakness in most (all?) similar radios.

I'm not aware of any that auto ID. Of course I'm not aware of every radio out there so there might be one. And the only reason I would use a timed auto ID would be for cross band repeater use. There might be instructions on how to build something that would plug into the mic jack and provide PTT and your call sign in Morse code.

2431. Remote Head Info

Yahoo group: Anytone_AT-588UV
Date: 2013-11-06 03:16:18 UTC
From: Richard Gaun
Topic: 2431 Message: 2431

I have come to the conclusion that it would be better for my mobile operation that I try a different location for the radio using the remote head option. I have looked all over the "net" for instructions on head removal and mounting with the kit. I have not found any reference to any type of discussion or instructions on the topic. Which leads me to believe that it is a very simple procedure, so simple that even I can do it...LOL
So, for those of you who have remote mounted the control head is that the case?
Thanks!!

It's really no big deal, the bracket accessory isn't needed in most cases.
If the remote cable that came with your radio is long enough use it.
Otherwise a CAT5 Ethernet cable will work the same. The bezel that connects
the remote head to the radio can be removed and mounted where you want to
mount it. Then the remote head will just snap into it. Take a good look at it and you
will see what I mean. Three pieces, radio body, bezel, and remote head. The radio
remains intact without the bezel. The eject button is on the right. I think you pull
it towards you and the radio will slide off the bezel to the left. Take care for the
fragile
cable there now. I could see it being damaged easily, it's not very long. Other than that
like I said,
no big deal that requires a great amount of skill. If you can hammer a nail, you should
have no problem.

2434. RE: Re: AT-5888UV vs. Intek HR-2040

Yahoo group: Anytone_AT-588UV
Date: 2013-11-06 16:43:52 UTC
From: <dean@...>
Topic: 2029 Message: 2434

That was a very thoughtful and helpful explanation; thank you.

I have just purchased the Powerwerx DB-750X radio (similar to the AT-5888UV). It provides me with the ability to volunteer support for my Counties emergency services (LMR), and also to operate as a Ham. This radio perfectly suits my needs. I have found that there are many others with similar needs.

I did not purchase this radio because it was cheap, I purchased it because it is the radio that best meets my needs. If Yaesu/Icom/Kenwood/etc made a similar radio, I probably would have purchased one of theirs.

---In Anytone_AT-588UV@yahoogroups.com, <n7kuw@...> wrote:

There are some very high end ($5000+) radios that are multi-band land mobile radios. In general though, there is virtually no demand for that capability. A company, or entity (such as fire department, city, etc.) will typically license in a single band. In a few cases, interoperability with neighboring services (e.g., fire dept in the next county) will require having more than one band, but that market is too small to get most of the manufacturers to develop multi-band product.

Almost without exception, a dual or multi-band radio is going to have worse selectivity, and will be more sensitive to intermod, than a single band radio. That's just basic rf engineering, you can design for wide receive capability or for high selectivity, but it is hard (and costly) to do both.

The Anytone (and Powerwerx, et all) radios tend to match specs with most dual band amateur radios, but tend to not match specs with most single band commercial radios. That is one of the tradeoffs you must be willing to accept when you go for the low-cost "does it all" radio. That isn't to say the Anytone (et all) is bad, it has it's place and will serve many people quite well. But there are those whom it won't serve well.

The land-mobile radio marketplace is evolving. I'm not sure yet whether that is good or bad. Many end users are now the people who are programming and placing radios into service, and unfortunately in many cases they are not doing so in compliance with the license requirements (they are probably not even aware of the license requirements). Sooner or later, the FCC is going to make an example of someone. Some poor volunteer fire department or similar agency is going to end up with improperly programmed radios operating under their license, and take a hit. Commercial and public safety are radically different from amateur with regard to licensing, equipment and antenna requirements, etc. You can't just add a radio to a system (the license specifies how many are allowed), or increase the power (the license specifies how much, or little, is allowed), or even change an antenna (the license probably specifies ERP), without knowing what the license permits and knowing what you are doing. Therein lies the challenges with the flood of low cost, end user programmable, Part 90 certificated radios. And with a radio like the Anytone, if you program it and leave it with the ability to operate in VFO mode, it is no longer Part 90 compliant. You've got to lock out the VFO mode in order to do Part 90. So that rather significantly limits the usefulness of the radio for amateur purposes.

Warning: It's a very short cable. Only an inch or two long.

I used too much force removing the head and tore the cable out of the connector. (I wasn't sure how the release worked and failed to ask.)

Hi,

I didn't see a nything in the manual so I thought I'd just check here to be sure. The Any Tone doesn't have a VOX option does it? I'l like to set one up for hands free operation.

Thanks

What the hell does your reply have to do with the question
about Anytone VOX?

Sorry but no VOX setup that I can find anywhere.
I'm wondering how many dual band LMR mobile
radios have a VOX function? I know the hand held
LMR radios from Wouxun and Baofeng have VOX
and it makes more sense to have VOX on an HT
or shortwave than it does for a mobile rig if
you stop and think about it.

I don't think any LMR have VOX either. But it would be a nice option if you were useing the radio as a desk top unit.

Would something like this work to open the PTT?
http://www.amazon.com/Voice-Activated-Switch-VOX-Kit/dp/B008MOOBTW
http://www.amazon.com/Voice-Activated-Switch-VOX-Kit/dp/B008MOOBTW

or is there a better option for adding a VOX to the radio?

Thanks again.
Ken

There is a diagram of the mic connector with the functions of each pin clearly marked. Kludging a VOX to that seems like a great exercise in home brew.

When I first entered the ham scene back in 1990 we kludged a lot of gear
to make it work. There was nothing like the smell of Captain Black pipe tobacco
and Kester rosin core solder wafting through the shack on a freezing mid-winter morning
but had I thought about inhaling lead also I probably would have though different.
This kludge project might work if the kludger has sufficient skills and motivation.
And I can see this to be useful for a LMR or public service dispatch with a small
headset. But it's going to take some work to perfect.

2446. DTMF not reliable on my radio

Yahoo group: Anytone_AT-588UV
Date: 2013-11-09 19:01:11 UTC
From: jwheatleyus
Topic: 2446 Message: 2446

I just installed a new phone patch and it does not reliably recognize DTMF from my AT-5888UV. It works perfectly with any other radio, so I assume my radio is putting out bad tones.
Anyone know if the DTMF tones are generated in the Mic or in the radio? The DTMF seems to be cleaner and more reliable if I program the number into the radio and then send it rather than manually key it in.
I am wondering if replacing the DTMF Mic would fix the problem.

Did you try lengthening the tone duration or timing or whatever settings there are in the Anytone software? Maybe the tones are too loud, not loud enough, don't persist long enough, but without opening up the software I do remember seeing some settings to tailor the DTMF output. Have a look if you haven't already.

I know the tones need to be generated within a certain tolerance
of the base frequencies. These are still ITU standards. My shop's R8000
comm system analyzer would be able to show what frequencies
the tones were and if they were good enough to be usable. But that don't do
you any good. I would say that if the tones sounded loud enough and not
distorted on the patch end that they could be off frequency. And with no
service literature it's hard to say if the tones are generated in the mic
or in the radio. I guess if you pulled the mic apart and got a look at the components
inside that you might be able to write down numbers of whatever chips are inside
and to a little data mining and see if one is a tone generator. My guess is the
generator is inside the radio. Also what's your phone patch setup? Just curious.

I ran a test- listened with headphones on a receiver and transmitted DTMF from a handheld that works and from the AnyTone that doesn't. The AnyTone DTMF sounds 'flat', quite different from the good radio. I opened the Mic and there is a 32 pin chip Micro Controller. I suspect it handles the UART data transfer to the radio. The controller could generate DTMF or it could just pass tone commands to the radio to actually generate the DTMF. Either way I still have a problem with bad DTMF!

> I ran a test- listened with headphones on a receiver and transmitted DTMF from a handheld that works and from the AnyTone that doesn't. The AnyTone DTMF sounds 'flat', quite different from the good radio. I opened the Mic and there is a 32 pin chip Micro Controller. I suspect it handles the UART data transfer to the radio. The controller could generate DTMF or it could just pass tone commands to the radio to actually generate the DTMF. Either way I still have a problem with bad DTMF!

Sounds like the tones are way under-deviated. Look around in the software
and see if there is a level adjustment to make them louder. Other than that I don't hear anything
else odd.

I have used an app on my iphone, irlp me. It has a dtmf generator. This works fine through the mic all the time. I can also confirm that when I program the dtmf tone on the radio, it works. Seems like though that it delivers it very quickly and without a delay between tones.

Sure wish Anytone would fork over some service and alignment errata to me. They've already denied me once for fear it would fall into the wrong hands and their design would be stolen and recreated. I don't know who they expect to work on these things when they break down or need tweaked as in this case. A decent LMR tech could repair and align these provided there aren't any proprietary guts inside.

It's not an issue of the mic not sending tones. The issue I've determined by comparing the tones sent from an AT5888UV versus a radio that sends tones that can be decoded is that the tones are just not quite loud enough. So the deviation needs to be bumped up a few notches. And this seems to not be an isolated issue.

From: Milton Hywatt
Topic: 2464 Message: 2464

Trying my best to get some questions answered as far as repair goes.
If Anytone wants to keep selling these radios there needs to be a reasonable method to get your radio repaired/aligned, etc.. Right now there is no method. And shipping it back to China isn't an option. Besides not knowing where to send it, it will cost $67 each way to send it back to the factory. So knowing there are many of these radios in the hands of owners now Anytone is going to have to get off their butts and set something up and maybe partnership with a US firm and a European firm for repairs. Some resellers are sitting on defective radios

that they have replaced that they can't afford to ship back to the factory for repair or exchange. So for know it would be in Anytone's best interest to cough up some quality service and alignment literature.

Just my opinion...

In today's world with Service shop rates at $95 /hr. and above, the low cost of this unit makes it a throw-a-way rig. If you loose a PA or some other hi cost component the combined cost of parts and labor would more than the cost of a new unit. Perhaps the best approach is for Anytone to offer a flat rate exchange price for the dealers who sell this rig in the US. This does not mean, however, we do not need good documentation.

I am a happy AT VU-5888 owner!

On another note : When you have more then 1 DTMF group encoded. And one of the programmble buttons on the mic to do callout. How can you easily switch between the 2 groups, without going into the set menu.

Also it was suggeted that maybe the deviation was low due to the radio being in narrow mode, however this wasnt the case.

I hadn't thought of that since I don't use a phone patch or need control
a repeater, basically don't use DTMF at all. Maybe there is a way maybe not.
And yes I thought that operating in narrow bandwidth might have something
to do with the problem but I know the first person who started the topic knows
plenty about the radio and would have thought of that.

So you are indicating that if you use the keypad to tone, whatever you are toning does not decode properly but when you pre-program tones, it works every time?

If so that's an important observation. Also in the software, don't you program toning per channel? I don't remember since it's been a while since I've used Anytone's software. However I guess I will have to go into the shack and fire up the PC. I use a MacBook Pro for 99.99% of everything except those that I can't get to run on Mac like the Anytone software.

I mean that if i am on a IRLP repeater and enter the dtmf from the MIC it doesnt work. If I program the DTMF encode, by going into the Set menu and then DTMF W, and use the program Pd button on the Mic as callout. Then it works. However that will just send the one that is programmed. If i then want to disconnect the node with a "73" then i need to use the mic pad again, which is unsuccesful.

So you are indicating that if you use the keypad to tone, whatever you are toning does not decode properly but when you pre-program tones, it works every time?

If so that's an important observation. Also in the software, don't you program toning per channel? I don't remember since it's been a while since I've used Anytone's software. However I guess I will have to go into the shack and fire up the PC. I use a MacBook Pro for 99.99% of everything except those that I can't get to run on Mac like the Anytone software.

Works fine when the dtmf code is programmed into the radio.

---In Anytone_AT-588UV@yahoogroups.com, <mhywattt@...> wrote:

It's not an issue of the mic not sending tones. The issue I've determined by comparing the tones sent from an AT5888UV versus a radio that sends tones that can be decoded is that the tones are just not quite loud enough. So the deviation needs to be bumped up a few notches. And this seems to not be an isolated issue.

So what you are stating is tones stored in the radio's memory are more liable than when they are generated by the microphone. There are a total of 16 groups and if you rotate the Main
channel encoder knob you can easily scroll through those 16 and chose the group you want. --- Press Set, rotate to 15, press Main channel encoder to enter #15's function and rotate
Main channel encoder knob to the group you want. Press Set to go back to #15 and PTT will TX the code. Now at this point I'm not sure if the radio exits the Set menu or not. But
if it does, item #15 will remain when you press Set the next time and then just repeat the function process to switch groups. Not that big of a deal. I guess I need to get off my butt
and hit the shack and check into this.

I'm not sure what the difference is from sending DTMF from the mic vs sending DTMF from memory
but it sure would be nice to have some service literature with a flow chart and schematic.

Right,

yes the ones stored in memory do fine. So my next question is if i have "5883" setup in group 1 and "73" setup in group 2. By pressing programmable button Pd on the mic i can transmit group 1, but is there an easier way to toggle to group 2 without having to press set and go through the menu.

button Pd is programmed with the callout function.

Not that I know of yet. If there is no other way it's still set - #15 - encoder press - rotate to
group 2, encoder press and PTT. Would be nice to set up an ABDC button to switch to the next group but how would you know which group you were on? I'll have a look at the software as soon as I finish up with my Yahoo groups and see if I can figure something out. Or if someone
is following this topic and already knows please chime in.

This is a way to solve the two number problem. Program the same repeater setup in two adjacent channels but put two different DTMF setups in the channels. Now you just turn one click of the channel knob to change DTMF. This is a sucky solution but it would work.

Yeah that's one way to do it. I think you have to press the UP button on the mic before you press PTT. If that's the case you wouldn't need a third channel with no DTMF if this is a repeater, you would be sending DTMF each time you key up otherwise.

It only sends the dtmf tone when you press the Pd button on the mike not everytime you key up.

---In Anytone_AT-588UV@yahoogroups.com, <mhywattt@...> wrote:

Yeah that's one way to do it. I think you have to press the UP button on the mic before you press PTT. If that's the case you wouldn't need a third channel with no DTMF if this is a repeater, you would be sending DTMF each time you key up otherwise.

This is a way to solve the two number problem. Program the same repeater setup in two adjacent channels but put two different DTMF setups in the channels. Now you just turn one click of the channel knob to change DTMF. This is a sucky solution but it would work.

If I program the DTMF encode, by going into the Set menu and then DTMF W, andÂ use the
program Pd button on the Mic as callout.Â Then it works.Â However that will just send the
one that is programmed.Â If i then want toÂ disconnect the nodeÂ with a "73"Â then i need
to use the mic pad again, which is unsuccesful.Â

I meant with different DTMF tones programmed into each channel. I know you can do 2/5Tone encode per channels but you must press the UP button while holding the PTT down to get them to TX. I'm just thinking out loud per John's method of programming two channels identical side by side but each having a unique DTMF code. This is where I'm saying you might have to use the UP button to get the tones to TX.

Program one of the 4 buttons on the mic as a Call button- when you press it the DTMF goes out.

So that activates the PTT and sends the DTMF while in the channel mode?
Then to change the DTMF just switch channels with a different DTMF programmed?
Sounds pretty simple to me. Did you try pre-programmed tones with your patch yet?
Did it work? Were you using the mic before?

Unfortuately it doesnt look like you can have seperate DTMF groups for different channels. If "5885" is in group 1 then it is across all memory banks and VFO. You can;t switch to group 2 without going into SET, DTMF W, etc. etc.

I tried it on my radio and it works. I put a number in M1 and another number in M2. Then I setup two identical RF channels except go to 'More' column and select DTMF M1 in one and DTMF M2 in the other. Go to Function Setup and set one of the 'P' keys to 'Call'.
To use it, press mic 'P' key (No PTT) and the radio keys up and sends the DTMF. I used it to call a number (M1) and then to hang up the autopatch (M2) and it works OK.
This does not solve my problem because I need to dial any desired number and can't store them all!

OK well after dinner I'm going to have a look. I was almost certain you could set up different toning sequences for different channels. But then again the only tone encoding setup I've messed with was 5Tone for another list member. It's our net night on 2 meters, three different clubs that I check into and one has a swap and shop where you come across some decent gear at cheap prices from time to time. I'll get back later and I know it's a lot
of traffic but some people especially me aren't the greatest when it comes from learning out of a book especially a poorly translated from Chinese user manual.

Okay will try this. I presume when you say you went to more to program the dtmf tone that it was with the s/w and not in the SET menu itself on the radio?

Yes the More selection is at the right side, in a cell called More. Just double click on it and you get some more options.

Yes, Milt, The patch accepts the stored tones and does not like the keypad tones. I did not do an exhaustive test- I put 54196133581 in M1 and 540 in M2 and that was the test. When I send these same sequences from the keypad, the long number never is successful and the short number will get through in maybe one out of five tries.

Ok we are starting to uncover some facts here. But they can only lead to speculation since I have no service literature yet. I'll talk to one of the guys at the shop and see if he's ever experienced this. They work on LMR stuff and I'm sure they are into systems Knox Box and others that need tones.\
Thanks for all your input.

And we appreciate your help too. It's dinner time here so I'll eat and do
a little data mining with my radios and Anytone and Chirp softwares. I
might come across something and in the meantime I'm going to send some
email off to my Anytone contact and update them on what we've discovered.
I'll also fix up a test jig to measure the audio voltage from a received DTMF tone
from the mic and from the memory and see how they differ now that we know
the tones stored work where the tones issued by the keypad don't.

2499. DTMF toning.

Yahoo group: Anytone_AT-588UV
Date: 2013-11-13 20:02:20 UTC
From: Milton Hywatt
Topic: 2499 Message: 2499

So I got to actually play around with this last night.

I found the easiest way would be to first set up your
toning sequences in the DTMF list, M1 - M16. Then in the

channel row just select More and go to the Optional Signaling
line. Drill into DTMF and you will notice M1 pops up beside it.
Drill into that for the proper group of tones. Save the file and upload
to the radio. Now when you transmit on that channel and press the UP
button the radio will send the group you selected. If you need to send
more than one group of tones on the same channel and don't want to change
it in Set menu item #15, then copy the channel to an adjacent memory position
and change the group to which ever one you programed into the DTMF

menu. You may even program these into hyper memory to keep them out
of your regular channel list. I didn't get to test that out. But the other way

works. You can also use the Call method using the ABCD#* keys but it seems
just as easy to set the channel(s) to DTMF signaling and the group you want
to send.

The radio reviewed in QST was a prototype according to my friend. Anytone sold a bunch of prototypes initially. The software issues were resolved after in the newer models.

My response is “YES”.

I am more then willing to pay a fair price for equipment, but I am not willing to pay for “A NAME” or the added cost a company must add onto the price of it's equipment to run glossy fill color ads in magazines like QST or CQ. In fact, that is why I no longer get QST... over priced, heavy on the advertisements and slim on content. That is why I have not renewed my ARRL membership for the last 2 years.

I do understand that advertising is crucial to a magazine, as I worked in the media field (TV) for years. I also know you don’t bite the hand that feeds you. So, if something new is on the rise and they don't help pay the bills there fair game.

As it is the AT-588UV is a good little radio and I heard about it by word of mouth. I then took mine to a CERT meeting and 2 friends saw it heard it and each purchased a unit. Both have had there units for a few months now. One of the guys talks to me daily as I'm driving home from work. His radio sounds great and we are all pleased with them and have had no issues with our radios.

This is a new world and social media will bypass whatever negativity you have done to the AT-588UV. Those of us who like our AT-588UV will post about it, blog about it, YouTube about it, tell all our HAM friends about it and the word will get out.

The AT-588UV is a GOOD radio at a GREAT price.

Respectfully,
Paul
W3PCJ

---In Anytone_AT-588UV@yahoogroups.com, <anytone_at-588uv@yahoogroups.com> wrote:

I have 3 of the AT-588UV units, All are working excellent. I did have an issue with a crossed wire in one Mic cord, cat IV connector but a phone call to Ed, the dealer, he shipped a (no questions asked) replacement the same day. Two days later, it was in my mail box, and I was on the air.

He didn't even ask for the defective one back, but out of courtesy, I sent it to him for repair (or spare parts).

I have been extremely pleased with these radios.

Note. I discovered that they have an excellent application in locating a repeater jamming station in the area.

You put the repeater frequencies in on both sides of the radio, but select the reverse frequencies on one side.

Now you can see the repeater carrier frequency on one side and the Jamming frequencies on the other side. A hand held directional antenna, out the car window, and with the two separate AT-588UV signal strength indicators, you have it made.

Subject: [Anytone_AT-588UV] RE: Harsh qst review.

Hi, Everyone,

I'm the guy who wrote the Anytone 5888 review, and I appreciate the comments here. I joined this group and others to do some research on your experiences with the radio, and even asked a question or two.

I noted in the article that many hams like their 5888's, and would consider my review harsh. And you do. I related my experience with one radio. I noted that not everyone had the problems that I did, but that it wasn't hard to find others noting most of those problems. I even uncovered one that your moderator hadn't seen, but was able to duplicate.

I don't know where ARRL got the specific radio I reviewed. They bought it early this year, did their lab work, and sent it to me in April. I don't know if it received updates. They buy the review units the same way you do, anonymously from a dealer, so they don't get anything that's been tweaked just for a review.

The ARRL and dealer now know each other, and I haven't heard about any response from the dealer based on the review. ARRL's policy is to send a review to the manufacturer for comment. I've seen responses included in other reviews I've written, but QST has always included my criticisms, while noting a manufacturer's response if it has a valid counter-argument. If they need a follow-up from me, they ask.

As someone else here noted, $300 is not a throwaway radio, as some of the sub-$50 HTs are.

As for me being an ICOM/Kenwood/Yaesu guy... I'd LOVE to have lower cost alternatives. But they have to work. This one didn't. And as I said, I expect that to change. I expect that the Chinese manufacturers (who are capable of making some superb products) to get it right sooner than later.

On the other hand, do we want all our equipment to come from faceless, nearly nameless, opaque and invisible companies that don't have a true American (or worldwide) presence; that don't come to our hamfests, advertise directly in our media, and communicate directly with us, and have only "generic" websites?

The Japanese companies aren't perfect. They started very much the way the Chinese companies are: domestic products exported through a handful of small dealers in the US, and eventually growing into the world market, with sales and service in many countries. They show up at our hamfests and advertise in our media.

Still, I've heard plenty of complaints that in terms of products and engineering, they sometimes don't listen to their international sales people. That certainly happened with D-STAR. The Japanese engineers didn't understand how we wanted D-STAR to work, and initially dug in their heels and refused to accommodate the kind of networking we wanted. They can be slow to acknowledge and correct design or production defects (but they aren't unique in that). Not everything they introduce is perfect out of the gate. But it's closer. Their products reflect maturity of design, manufacturing and marketing. They're getting better at understanding the wants and needs of their customers.

It's pretty routine for a reviewer and QST to be accused of bias or knuckling to pressure from a big advertiser. My experience is that if I'm critical, it gets printed. At most they'll round off a sharp edge to a comment, but the substance stands. I am an independent reviewer, not an ARRL employee. For the 5888, they printed what I wrote, and actually toned my language down just a bit in spots.

I understand that if you like a radio, and someone comes along and bashes it (especially "officially" with a big audience), you're going to feel defensive. If you know something that moves the discussion forward, by all means let QST, CQ, or whoever published the article know. And let the reviewer know. We're not anonymous! Our email address is published with the review.

What goes through my mind is I don't believe it states where they got the radio from? Some may ask what does that matter? but from what I have been reading over the past months it does matter.
Some suppliers have had lots of problems with their inventory with wrong bands, older firmware etc supplied and only 3 weeks ago Anytone implemented new firmware again.
I am a dealer selling Anytone, I have sold many hundreds of the 5888 and had one unit back only, yes ONE and that was because the guy really could not understand how it operated, it was no fault of the rig.
I have seen so many good comments by users the review kind of annoyed me.
In my opinion it almost seems as though no matter what Chinese radio is reviewed he is stuck on the Icom, Kenwood, Yaesu only syndrome? QST mag is heavily subsidized by advertising, shame the Chinese companies cannot give us something to change that but a Yaesu for $400 you can get almost the same (some say better) in an Anytone for $275
Well that's my 10 cents worth.

Yeah I'd like my radio to fetch my slippers, hand me my smoking jacket and pipe, pour me a glass of brandy and fetch the mail and newspaper. But it has some limitations. Most of the 640 some members of this group have positive views. A few, negative, and some say nothing. Even a few praise it. I will say that my two radios work. One really early off the production line could use a firmware upgrade but when used as a base radio any quirks are not an issue. Even though I have a high gain Cushcraft 2/70 B Ringo with the base of the antenna at 35 feet, Belden 9913 coax, and nearly a flat match across the ham bands I get no intermod or adjacent channel interference. The RX audio could be a little cleaner out of the built in speaker but a good external communications speakers takes care of it. And if you turn the volume up the distortion goes away. Again not a deal breaker for someone looking for an economical business band or radio that will work on amateur frequencies.

I'm glad I bought this radio before I subscribed to this mailing list and before I read that review.

I've seen complaints here of odd behavior, and that review combined with those complaints would have steered me away. I'll probably buy another one later this year too.

If fact, the only features I find myself wishing it had are scan groups and the ability to display freq on one side, and chan name on the other. But those are not a major thing for me.

just because I like to see what something does, I held down tv/sql while my 5888 powered up and the display toggled between mode 01 and mode 02 with the function knob. The only thing I did notice is that mode 02 would give errors when trying to send program to the radio. When I went back to mode 01 it worked. I tried to search for this but found nothing. Any ideas?

So did the radio behave the same in either mode other than programming?
No difference in the display? And by function knob do you mean the channel / multi-function knob?

I think you can take the bracket that holds the faceplate or "control head" to the radio and use it to remotely mount the control head. If that's what you want to do.

Jeez. Lighten up, man.

The remote mounting bracket is a separate piece. It is basically a molded 5 sided box with retainers that mirror the tabs on the radio so that the latch that allows the control head to be removed can work and hold it in place. It has an attached bracket that can mount in several different angles depending on if it mounts to a horizontal or vertical surface. That bracket is fairly large. I removed it and epoxied on a mount bracket (plastic) that fits on the mount that is bolted under a seat mounting bolt. I had to cut an extra exit slot for the 8 wire RJ45 cable because the factory exit spot is in the center of the back of the adapter.

I found it on line for less than $20. Bracket only, no cable. I used a short length of CAT V cable to the radio mounted under the seat on the driver's side. No problems with hum pickup on the mic audio.

Head Faceplate Mountng Bracket is not included with the radio. It is a special order item. A friend of mine ordered one and mounted his faceplate in the sunglass holder of his truck. Looks good. Contact your dealer to order it.

Hey, he's generally right about that. I pulled it off and
it could be used as a head mount. The only issue is that
there are two "lips" on the back that hold the front bracket
to the radio. Depending on how you wanted to mount it, you
might be able to do that. Thanks, I learned something I
missed before.

This maybe a bit elementary but I stuck Velcro to the bottom of the control head and mounted it on the top of one my other radios. The main radio is mounted at the bottom of the radio tree.

2518. cross band frequencies for satellite working

Yahoo group: Anytone_AT-588UV
Date: 2013-11-21 20:59:35 UTC
From: Todd Bloomingdale
Topic: 2518 Message: 2518

Good afternoon all,

Quick question for you. One of my radio friends does amateur satellite working and we were talking, Does the 5888uv have the capabilities to transmit UHF and receive VHF? I tried putting in the freqs just to check in the software and it didn't play nice. It kept reverting my vhf transmit to uhf.

so if that's not possible, I was thinking of trying it in VFO and have band A as my UHF transmit and put in the VHF receive on band B and turning off the mute option. Think that would work?

Todd Bloomingdale- KC9LOX

From: Milton Hywatt
Topic: 2518 Message: 2519

So you want to transmit UHF on one side of the radio and receive VHF on the other? If so there's no reason why the radio wouldn't. I can talk and listen on UHF on either side and listen to VHF public
service on either side in channel mode. And I'm confused when you say "it kept reverting my VHF
transmit to UHF". I thought you wanted to transmit on UHF. ? Shouldn't be confusing, it's like the
sat is a cross band repeater sort of but you listen on VHF.

Yup another owner suggested this months ago.
And if you are going to mount permanently, you
could be creative and if you are handy with tools,
make a flat piece of wood or aluminum to bolt
the bezel back onto. Then buy an angle bracket
at the hardware store, bolt it to the back then to the
dash or wherever. That way you aren't modifying the
bezel. I haven't eyeballed it up close so I don't know
exactly what that bezel looks like on the radio side
but if it's flat this could work. You would need to make
an opening for the cable to go through. Can you picture
this in your head?

Subject: Re: [Anytone_AT-588UV] Bracket

Hey, he's generally right about that. I pulled it off and
it could be used as a head mount. The only issue is that
there are two "lips" on the back that hold the front bracket
to the radio. Depending on how you wanted to mount it, you
might be able to do that. Thanks, I learned something I
missed before.

My wit may be on the crass side occasionally but in general
we all get along great. And as the group creator and owner
I have really tried my best to make it an easy going group
while being clear that I don't want a free for all. And I've only
given the boot to one person in the year the group has been
available. And that person was warned off list first.

Milt.

From: Milton Hywatt
Topic: 2503 Message: 2522

I did something similar with my old Nissan Pathfinder but I
used strips of 3M double sided tape designed to hold body
trim onto auto exteriors. This was with an older dual band Yaesu
that came with the remote kit including the bezel the control
head snapped into. I just taped it onto the dash under the factory
am/fm/cassette. I don't know what kind of adhesive they use in that
tape but it was almost impossible to get that bezel off when I traded
the Nissan in.

This maybe a
bit elementary but I stuck Velcro to the bottom of the control head and mounted
it on the top of one my other radios. The main radio is mounted at the bottom of the radio
tree.

Just program a UHF simplex channel and a VHF simplex channel. Put the UHF channel on one side and the VHF channel on the other side. Transmit on the UHF side and you are already listening on the VHF side

Ah! You wanted a shack mount and it looks very cool! I also own
an Icom 706MkIIG and the Alinco DX-SR8/T. The Icom is in my
2008 Ford F350 Lariat. Diamond HV7A antenna. Wasn't too interested
in the bands below 6 meters although the antenna does receive those bands
except for 160 meters very well. My AT5888UV sits atop the Alinco.
With a rubber mesh mat between so the AT5888UV doesn't slide down
or mar the surface of the alinco.

2529. Microphone Serial Data info

Yahoo group: Anytone_AT-588UV
Date: 2013-12-09 22:28:22 UTC
From: <brian@...>
Topic: 2529 Message: 2529

I am attempting to make an Arduino circuit for the Mic jack to control the radio. Does anyone know what type of serial data is used on the Keypad Serial Data wire? Is it SPI serial, I2C serial, what baud rate, is it bi-directional, etc?
I can figure it out with an oscilloscope and/or Arduino sampling, but why re-invent the wheel if someone already knows how Anytone microphones communicate with the radio.
Thanks in advance,
-Brian AB6D

2530. Re: [Anytone_AT-588UV] Microphone Serial Data info

Yahoo group: Anytone_AT-588UV
Date: 2013-12-09 23:37:25 UTC
From: Milton Hywatt
Topic: 2529 Message: 2530

My educated guess it is asynchronous bi-directional serial data at
about 19.2 khz. That seems pretty consistent with the Japanese radios
like the FT8800/8900. I have no clue for the pinout of the 8P8C connector
I begged the engineers at Qixiang for a little bit of service literature even
in Chinese but they said they feared the literature would find itself eventually
in the hands of a counterfeiter.

Hmm. I would be more likely to suspect they don't want to release that information because it has some other brand name written all over it - i.e., the counterfeiters and worried about being identified as counterfeiters. Semi tongue in cheek response :-)

I doubt that's the case. Qixiang is recognizable in communications electronics. And they do sell the rights to others to brand their radios, at least the AT5888UV. And I don't know of another radio being manufactured by others that is identical. There are others who badge the radio but I'm sure they have bought the right to do so and the radios are badged at the Qixiang factory. But you never know, the email I've exchanged with them seemed very sincere. And they accepted several of my recommendations for problems with the original batch of radios. I doubt a counterfeiter would bother or would have a booth set up at the Electronics exposition for their province which is populated by dozens of different communications manufacturers. I do know of one Chinese HT that for a while was counterfeited, the Wouxun KGUVxx series. Specifically the UV6D. I know an American distributor who said you could not tell the difference. I own two of those radios and they are my main go to radios. Wonderful performance all over and very sturdy. I ran over a battery pack with attached belt clip with my SUV and it caused no damage. That radio flew out the window on a corner and the battery and radio separated. The radio didn't have a scratch on it. So I bought another and a bunch of battery packs including some packs to load your own cells. Ok I'm starting to rant like I usually do so I better stop. Thanks for your tongue and cheek input :-)

From: <cavanadd@...>
Topic: 2533 Message: 2533

Sorry if this topic has been beat to death.

I just received my AT588 and am attempting to program it via Chirp. I installed the USB driver from the CD, and apparently my computer can talk to the radio as I can clone from the radio into Chirp. What I want to do is load some existing Chirp files I have from my Baofeng UV5R radios onto the Anytone. When I try to do so, the drop down box to upload the file won't move from the Baofeng.

Also, is there any way to import Chirp or .csv files into the Anytone software? It didn't look like it to me.

Thanks for the help.

Dave,

What you have to do with chirp to move files from your chirp files from your other radios is, first in chirp read from the anytone so that is loaded in the first tab.

Next open a 2nd tab with the file that you want frequencies to move to the anytone and just copy and paste the data from there to the anytone tab.

Once you have the data that you want in the anytones, save your anytone file, and send it back to the anytone radio.

As for csv or chirp image files, the anytone stock software is not compadible, so once your done with the chirp and moved the data to the anytone, just open the stock software and read from the radio, and you will have file compadible with the anytone software.

Chirp is the only software at this time that you can move around such as cut/paste data' as the stock software doesn't have that feature.

Hope this helps you out.

Thanks for the help. I fumbled around and finally more or less discovered this on my own after an hour or so. It was a long day yesterday and I probably shouldn't have been messing around with radio programming at 10:00 at night.

Once you get Chirp set up, I have found it works really well and is pretty user friendly.

Okey Dokey.. what I've read from a Chirp dood is that the simplest
way to clone say a Baofung UV5R to and Anytone AT588UV is to
do this. Read the Baofeng and save the img file. Then read the
Anytone and choose import. Supposedly you can directly import
the Baofeng .img into the Anytone template. I have not tried this
but it saves the steps of export to CSV, Give it a try I haven't messed
with it yet. I've got 4 MacBook Pro laptops I need to get diagnosed
by morning. Thank god for AHT (Apple hardware tools) that at least give
you a decent error report even though there isn't a book with all the codes....heh
So give it a try and lettuce all know what you find,

Milt.

2538. Using Chirp to share templates between different brand radios.

Yahoo group: Anytone_AT-588UV
Date: 2013-12-12 22:00:51 UTC
From: Milton Hywatt
Topic: 2538 Message: 2538

We were talking over in the Chirp users list about taking a snapshot of the memory and settings from a Baofeng UV5R and sharing that with say a Wouxun or Anytone.

Chirp has the ability to import its .img files from different radios. I was able to take the Wouxun UV6D .img and import it into an Anytone template. There were a few settings that were incomparable but that was easy to correct. Seems between the Anytone and Wouxan there is a little difference in the wording of Duplex settings.

So Chirp won't import a memory channel if there is something it doesn't understand. Worked fine with all 25 amateur channels. But 5 public safety channels the Wouxun template didn't like. I recognized how to correct this in the Anytone template and

re-imported it into the Wouxun template. This time it worked. So it was saved and

then uploaded into the Wouxun. And into the Anytone. Sure beats copy and past

or using a CSV files as a medium between the two radios doing an export to CSV and then importing that,. So if you're like me with a bunch of different brand radios this could be useful.

I have programmed my 5888 with our local repeater that has a ctcss code and have placed menu 16 on ctcss/docs, is this going to inhibit receiving. If I leave it on squelch as I drive around the Chanel locks up the radio with interference.

Me either. Jens from the Chirp development team made it known. It's not 100% perfect because of the differences between the radios channel requirements but it's well worth

it. You may have to change a couple things but only on the channels that didn't clone.

And if you try to copy and past one of those that didn't clone, Chirp will give you the reason
why it couldn't when you try a copy/paste. Then you can decide what to do from there.

If your only tone issues are for reception or decoding, You don't need to decode tone to receive the output
of your repeater. And if you are thinking that tone decode will remove interference you are wrong. You need
to find the source of the interference and eliminate it at the source.

Tone squelch (TSQ) can be used to ignore local computer digital hash, another repeater in a distant town with a different or no output PL or for only hearing actual voice traffic on a local repeater and not the CW ID if it is set up that way (many in NYC are set up this way).

Yeah but your problems lie with tone decoding you don't need it.
And that was the point regardless of decoding gives you. If you
need to listen and scan a channels that tone decoding doesn't
play with then disable it. I bought a GRE PRS-600 digital trunking
scanner a year ago. Part of out public safety com is APCO 25 800 mhz.
our PD is still conventional VHF. Being only a mile away from the repeater
I couldn't use tone decode. The radio would not stop when that channels was
active. But as long as I used the telescope antenna with the scanner it would
stop. Only reason I wanted to decode was the intensly loud CW ID. You know
how it is...listening to a frequency, maybe dosing off in your easy chair and all
of a sudden this 120 decibel CWID is received. TWICE. So I had to use the telescope
antenna so I could RX with decode. Stronger signals with a roof top gain antenna
was too much for the scanner this close to the repeater. So yes there is a place
for PL decode but if you need it and can get around the inconveniences of an open
channel with carrier squelch you do what you have to do. I have zero service info
on these radios. And I'm not about to start up a shop to repair even if Anytone
sent me all the parts and equipment I needed. Those are things that anyone should
have weighed before making the purchase.

This observation I admit I didn't know, even if you put in transmit/receive data in the fields on the software program, I figured in order for the radio to start using tone in the arrow tab on the far right field on the software there is a check box and scroll down to start using the receive tone feature.

I think his tone is working. And I'm not sure if he is even using Chirp. He's having problems while scanning channels that are set to decode tone. Somehow one side of the radio is interfering with the other as best as I can gather. My old 588UV
I won't even bother scanning in dual channel mode because the sides interfere with each other and not even in tone decode. It's more like pops in the audio as the marshal side scans past UHF channels and the other side receives VHF.
It's usable but I don't like to hear those 4 pops in a row from the UHF channels. So I use it as a base and scan the UHF with an HT. The newer radio doesn't make those pops but it will crackle in the 155 mhz range on rx if that side of the
radio is not marshal. Now get this, it only crackles when I start moving. LOL! And stops when I stop. Go figure. If you make it the marshal side no crackling occurs and it doesn't crackle in the VHF ham band or UHF.

This observation I admit I didn't know, even if you put in transmit/receive data in the fields on the software program, I figured in order for the radio to start using tone in the arrow tab on the far right field on the software there is a check box and scroll down to start using the receive tone feature.

Milton,

Now you mention the crackling, yes this drives me crazy. Like you said, does it moving, stop moving it goes away. And yes while im scanning I also get the pops from uhf. I got tired of it and took my uhf freqs out of scan because of this.

Anyways, sorry for hijacking the post. Back to the situation at hand.

No problem, glad Yahoo email is working again after a 3 million user outage. I'd log in to email and there would be nothing. I'm used to getting maybe 30+ email a day from the Yahoo groups and Chirp list. Sometimes 40. So to log
in and see nothing I figured an outage. And in the Yahoo news they issued an apology and explanation. Anyway, thanks
for your input. That un-marshal'd crackle while only moving and only in 155+ MHZ has got me stumped. I can't ask any
techs at the shop because all they do is laugh. But as the boss put it very early on, "piss poor shielding." This guy is a guru so I take his word as gold.

Try Carrier Squelch. These radios have known problems with RF squelch. Make sure you turn off RF squelch because the radio can actually use RF and Carrier squelch at the same time. Switch to Carrier squelch set at around 10 and report
back.

I just passed my advanced electronics installers course, the crackling while moving might be from the gears meshing and breaking contact from each other and producing rf noise. When i install radios in fishing vessels i have to ground the propeller shaft (inboard) with a grounding brush or else I would get noise. It's raising the grounds level and affecting all devices. Could also happen from disc brakes rubbing for part of the rotation, i have a swelling sound in my at5888uv installed in my tj jeep but only while moving and it changes rate when i change speed

Tin Foil hat and make sure you hold your 2nd hand oit the window while driving as an extra antenna.....that should work. The foil hat will reduce internal interferance and your hand will act and a second attena.

I can understand the crackling noise while moving, could be a Tone Ring
for the anti-lock breaks. Traction control monitoring equipment etc...
But the crackling noise does not appear on the Main side of the radio
be it on the left or right. And only occurs on VHF above the amateur band.
Doesn't affect UHF at all. That's what has me baffled. Any thoughts on that?

2560. Setting up memories?

Yahoo group: Anytone_AT-588UV
Date: 2013-12-16 06:30:38 UTC
From: Dave C
Topic: 2560 Message: 2560

Can anyone walk me through how to set up the memories on the AT? The manual mentions home and hyper memories, but doesn't discuss how to set them up. I use the radio exclusively (so far anyway) in channel mode using channels programmed in via Chirp, but being able to set up memories would be handy.

I did review the procedure in the Yaesu FT-8800R manual I found on line, but it wasn't much help.

Thanks
Dave

Memories are channels. Same thing. Hyper memories I think you can have one for each band. Home frequencies are not modifiable. At the end of scrolling through your channels you will notice if your display is in the name mode channels named L1 L2 etc... Those I believe are the hyper memory channels. I don't mess around too much with those, actually not at all unless for the sake of the group members. There are a couple members who are a lot more proficient with this kind of setup. But using the the factory supplied software. Maybe Chirp too but Chirp doesn't cover the radio completely. If I were you I would just set up your channels in Chirp, forget about the hyper stuff, it's not real useful anyway, and use the radio like that. If you want home channels like the national simplex calling frequencies 146.520 / 446.000 just set them up in a channel because again you can't modify Home and make the changes stick.

2562. Front panel to main body communications

Yahoo group: Anytone_AT-588UV
Date: 2013-12-16 22:53:30 UTC
From: Milton Hywatt
Topic: 2562 Message: 2562

A few days ago I replied to someone looking for information

on how the front panel communicates for the radio body
and vice versa. After data mining for a few days on and off
I'm convinced that it may be very similar to the Yaesu Ft8800.
Here are a few tidbits of info that may give you a head start.

The head unit continuously sends a 13-octet packet to the main unit, with a brief delay between each packet. Testing confirms that if this packet
is not sent for some time (on the order of 1s), the main unit shutsdown. This "watchdog" basically activates if something were to break
communication between the head unit and the main unit. Although the raw
line coding of the packet is with 8-bit data words, display information
is only encoded in the lower 7-bits of each word. The MSb is used as the synchronization bit and is 1 in the first octet only.
The head unit sends a fairly raw representation of the input switches and
dials. It does not seem to do any high level processing. The packet
contains no CRC or any bits dependent on other bits outside of a single
function group.
Except for the hyper-memory keys, the keypads are implemented with matrix
multiplexing and/or resistor dividers. The head unit uses an ADC and
seems to pass these counts unmodified to the main unit which must deal
with range checking. The specified count values below were recorded with an actual unit, but it should be obvious what the "nominal" values are, and since the resistor dividers are on the schematic, it is easy to
cross-check.

Parameter (Unit)
Description
Value
Communication Asynchronous communication 19.2 kbps 8-N-1 (8 data bits, no parity, 1 stop bit)
Head unit update period (ms) Time between start of panel unit
TX packet to start of next packet TBD (on order of 20)
Main unit update period (ms) Time between start of main unit
TX packet to start of next packet TBD (on order of 40)
Watchdog Time (s) Minimum time between last update packet
from panel unit and when main unit shutdowns (powers off) TBD

Main unit Packet
The main unit continuously sends a 42-byte packet to the panel unit. This packet essentially contains a raw bitmap indicating what LCD display segments should be illuminated. There seems to be no other higher level

coding included in this packet. Although the raw line coding of the packet is with 8-bit data words, display information is only encoded in the lower 7-bits of each word. The MSb is used as the synchronization bit.

Testing confirms there is no CRC or other dependent bits in the packet. Each bit has been demonstrated to be independent. Although the main unit will only activate segments in certain ways, the panel is essentially a dumb terminal and will accept any type of bitmap combination.

The following table maps the "Yaesu" natural order assignments to one of the "conventional" 14-segment pin assignments. It should be noted that the Yaesu assignments were not per any Yaesu documentation and simply chosen in alphabetic order based on the ordering of bits in the control packet. The "conventional" ordering is based on LED segment datasheets. There is another assignment nomenclature that uses G1, and G2 for the horizontal segments. Unlike with the 7-segment case there doesn't seem to be any prevailing standard that is near universal. The third column maps bits. The bit assingment is based on numbering the Yaesu case in order, but skipping the unused 8th bits in each byte, but including the unused bits that are used for other segments, since those form a regular pattern in every case. The last column (Rep 2) is a simple ordering from 0 to n.

Segment Mapping Table

Description

Most segments are duplicated on left-and-right (indicated by subscript)

Digits are numbered least-significant to most significant (right to left) starting at 0.

The 14-segment displays used only have 13 addressable segments. There is only one addressable vertical segment.

Subject: Re: [Anytone_AT-588UV] Re: Using Chirp to share templates between different brand radios.

I can understand the crackling noise while moving, could be a Tone Ring
for the anti-lock breaks. Traction control monitoring equipment etc...
But the crackling noise does not appear on the Main side of the radio
be it on the left or right. And only occurs on VHF above the amateur band.
Doesn't affect UHF at all. That's what has me baffled. Any thoughts on that?

I just passed my advanced electronics installers course, the crackling while moving might be from the gears meshing and breaking contact from each other and producing rf noise. When i install radios in fishing vessels i have to ground the propeller shaft (inboard) with a grounding brush or else I would get noise. It's raising the grounds level and affecting all devices. Could also happen from disc brakes rubbing for part of the rotation, i have a swelling sound in my at5888uv installed in my tj jeep but only while moving and it changes rate when i change speed

Milton,
Now you mention the crackling, yes this drives me crazy. Like you said, does it moving, stop moving it goes away. And yes while im scanning I also get the pops from uhf. I got tired of it and took my uhf freqs out of scan because of this.
Anyways, sorry for hijacking the post. Back to the situation at hand.

On Dec 14, 2013 6:44 PM, "Milton Hywatt" <mhywattt@yahoo.com> wrote:

I think his tone is working. And I'm not sure if he is even using Chirp. He's having problems while scanning channels that are set to decode tone. Somehow one side of the radio

is interfering with the other as best as I can gather. My old 588UV
I won't even bother scanning in dual channel mode because the sides interfere with each other and not even in tone decode. It's more like pops in the audio as the marshal side scans past UHF channels and the other side receives VHF.
It's usable but I don't like to hear those 4 pops in a row from the UHF channels. So I use it as a base and scan the UHF with an HT. The newer radio doesn't make those pops but it will crackle in the 155 mhz range on rx if that side of the
radio is not marshal. Now get this, it only crackles when I start moving. LOL! And stops when I stop. Go figure. If you make it the marshal side no crackling occurs and it doesn't crackle in the VHF ham band or UHF.

This observation I admit I didn't know, even if you put in transmit/receive data in the fields on the software program, I figured in order for the radio to start using tone in the arrow tab on the far right field on the software there is a check box and scroll down to start using the receive tone feature.

I have set tx/rx to pl 103.5 so I don't revive unwanted transmission, I live in an urban area and eliminating unwanted transmission is difficult as I spend a lot of time in my truck. Setting the squelch higher hasn't resolved the issue either.

You can change the Home channels.

It all available when setting up the Hyper channels.
Here's how to do it.

ANYTONE QPS5888UV PROGRAMMING

HYPER MEMORIES
1. Programming memories into Hyper1 or Hyper2.
A. Pick Hyper1 CH Edit.
a. Select "Channel" on the Mode boxes.
b. Select a channel number that has already been programmed
into the Normal CH Edit screen. When you pick the pull down
for the Channel box it will only show the channel numbers
for the channels programmed into the normal channel memory.
c. In the VFO boxes select the band for the VFO frequency
you want to go to when the V/M button is pushed for the
corresponding left or right display.
d. Now go to the table above and put the frequency you want
to go to when you push the VFO button. I.E. if you have band
108 MHz in the left VFO box you will put the frequency you
want in the L-108 row above, including any offset or CTCSS
or DCS tones and etc you want.
e. Do the same for the Right side.
f. The HL-108 and HR-108 etc rows are to programm the frequency
you want to go to when the Home (HM) button is pressed while in
Hyper channel mode for the Left or Right display.
B. So; 3 channels can be selected for each display while in Hyper1
or Hyper2 modes.
C. If you select VFO for the "Mode" then when Hyper1 or Hyper2 are
selected the display will go directly to VFO mode and the VFO
frequencies will be displayed.
a. To get to the channels you selected just press the V/M
button.
b. The Home channel remains the same also, just press HM to
go to your Home channel.
D. The same for putting Home in the "Mode" box, the display will
show the Home frequency in the display and you must press the V/M
button go get to the Channel or the VFO frequencies.
E. If you change the "Sub Display" to VDC then the display that is
not the Main display will show only the voltage. It can't be changed
by pushing any of the buttons.
F. If "Off" is selected then the display will be blank for the sub
display. You may want to do this if only one channel is to be
displayed in Hyper memory.
G. I have not checked what the check boxes to the right do. I have

left the check mark in "Auto Hyoer Save".

I had a sneaking suspicion that the home frequencies might
just have something to do with hyper memories. It made no
sense to just have an arbitrary frequency you couldn't change.
I keep telling myself I have to think Chinese when trying to decipher
how to use the QPS software. Well if you don't mind I'll save your
instructions to a text file and upload it to the file section. Also will
print them out for my own reference the first time I give this a shot.

Thanks,

Milt.

I'm happy it has helped figure out a little more about the radio.

It's fine with me to put a copy of the instructions in the files section.

Since I use my Anytone for Public Safety and Ham radio I wanted to
know more about the Hyper memory. I set up theleft side to bring up
2 local ham repeaters and the right side to bring up the county fire
frequencies. A quick push of the knob allows it to happen.
The Home frequencies on my right Hyper memory are set to
the National VCALL10 and VTAC11 Public Safety frequencies.
So it worked out pretty nicely for me.

Well thanks again. I see you're from NEO, same here. Never heard your call. I don't give mine out, a bit paranoid I guess. Do you use the NORMA repeater on 147.015 ? How about Alliance, or W8NP in Massillon? Any UHF like 442.000 in Uniontown? I'm not a bucketmouth and listen much more than talk. I've been known to check into various nets and am more active during stormy weather when Skywarn is up and the NWS has declared warnings. I use the AT588UV as a cross band repeater because I can't get into the Skywarn repeater with my HT while inside the house. That's one redeeming quality the AT5888UV has is it's superior operation in crossband. 5 watts out on both bands through a Cushcraft AR270B that its base is about 30 feet off the ground give great performance

Milton,

Don't get on those repeaters much; Alliance on occasion.

I am normally on 146.805 PL 162.2 in Lisbon and the new
Salem club repeater on 444.9625 PL 162.2 when I am mobile
in the Salem area.

I just got the Anytone and have not tried the cross band repeat function yet.
I've heard its easy to set up. May come to your for help. It will eventually
go into my car when the weather warms up a bit.

Alfred,

I tried to upload a picture of my QPS588UV software showing the
Hyper1 CH screen that has the HL and HR channel cells.
The photo section said there was an error then it said download
was complete, but I do not see the picture.

Maybe it has to be screened first by a moderator.

The Hyper1 and Hyper2 screens is where the HL & HR cells are located.
I am using QPS588UV v 1.0.1.

Anyone can upload files as long as they are under 4 megabytes.

After that the file has to be split. There is a file splitter/joiner that
I think might still be free called HJ Split.

Thanks. I was not aware of the new 1.0.1 software and after downloading it I now have and see the HL cells you refer to. I am though confused on how to activate Hyper channels and home. I programmed as you said but pressing -h- home button still brings up 145.150 and 440.000. And how do you program hyper channels 1 and 2 and access them? And I see no HR108 so I assume if you want a UHF Chl on the right you put that frequency in HR400 slot?

Thanks for your help

The HL108 and HR 136 both program VHF high frequencies.
I see I made an error in the tutorial text; the HR should have been HR 136 not HR 108.
So if you have 146.520 in HL and 146.580 in HR they will work.

I programmed mine with the MODE set to "Channel".
Then I put in the channel number for the frequency I already programmed in the
"Normal Channel Edit" page. I selected channel 3 (left) and 16 (right) for my Hyper
channels.

Then in the Hyper1 CH Edit, I selected 108 for the Left VFO box and 136 for the Right VFO
box.

All the frequency settings in the L, R, HL and HR rows are just like entering channel data
in the
"Normal Channel Edit" screen. you put in repeater split and PL if they are needed.

Let me know if that helps. I see I need to edit the tutorial anyway, so I will
put in what happens when the 'Mode" setting is changed in more detail.

Maybe I'll do it in Word so I can put screen prints in also to make it more clear.

For the left Hyper memory press the left volume know. For the right Hyper memory press the right volume knob.

Even though you used a Hyper memory your still in memory mode
and can change to other memory channels with the top left
and right channel knobs.

Hyper memory is just a quick way to get to 4 of your favorite channels.

From: <kb9efn@...>
Topic: 2586 Message: 2586

I am used to the yaesu 8800r where you can program each side of the radio (left /right) channels independently of each other
So far I when using the either chirp or UV588 software both sides of the radio (left/right) show the exact same freqs and channel numbers. Am I missing something?. Also If I set the channel skip on the left side, it also locks out the same channel on the right side.
Finally the manual calls for a software version named QPS5888UV_S1 software. That does not seem to exist under that exact name. Wonder if that is a typo in the manual?

The sides for the AT5888UV are not independent. I think some menu items might deliver changes to each side independently. And the Hyper memory feature that allows your quick access to 4 channels per side might also be independent of the radio sides. But in the channel mode no, you have one database for both sides.

The FT8800 had a unique memory structure. Much different than my FT8900 even. You would think there wouldn't be that much difference between the two Yaesu models. Is there a specific reason that you like to have each side independently programmable? I can't think of any reason I would need that feature other than in your case being used to be able to program them independently.

I have 2 8800s and during skywarn operation it is nice to have my home county on the left side of the radio and the statewide net running on the right side. This allows me to hear what is going on in surrounding areas without missing my home county traffic. When not in Skyward operation I have my ham radio stuff on the left side and our local public safety on the right side. So it appears with the any tone if I tried that configuration the public safety stuff is still going to show up on the left side and I won't be able to lock it out of the left side without locking it out of the right side as well. so if I'm in the mood to be scanning my ham radio stuff on the left hand side and the public safety frequencies are broadcasting something I don't care to listen to its going to Interfere with my left side ham radio stuff as well.

Topic: 2586 Message: 2591

I see your point. I like to listen to our city law enforcement while scanning the opposite side. I simply skip the law enforcement so the scanning side doesn't stop on it. and they make it pretty easy to skip and unskip channels. All it takes is a push and hold of the scan button. I'm also involved in Skywarn but there are so many of us including the emergency net controller and the liaison from our district to the NWS on 6 meters I usually cross band on the district repeater to an HT because I have difficulty hitting the repeater inside my home. I then listen to the 6 meter backbone which constantly updates the NWS with emergency traffic only. That's all I'm concerned about. I don't need to hear "it stopped raining here" or "we got pea sized hail here" that's not emergency traffic during a storm warning. So anyway that's how I get around scanning on one side when the other is stopped. I think that's what you are trying to accomplish. Also the AT5888UV has a 100% mute. So when you are listening to your skywarn repeater you can mute the other side. Personally I can't handle listening to both sides. And my FT8900's mute function might as well not even be an option because it only slightly reduces the volume on the deputy side of the radio.

2592. Default power setting

Yahoo group: Anytone_AT-588UV
Date: 2013-12-23 05:56:03 UTC
From: Dave C
Topic: 2592 Message: 2592

Is there any way to change the default power setting while in channel mode and have it stay there? I didn't find a menu setting. There may be a way to do it in the software, but I haven't looked there. Chirp files for the AT apparently don't support power, although my Chirp files for my Baofengs do.

Thanks

Most Chinese LMR radios need to be placed in what they call
Dealer Mode to get most in-channel settings to stick. Or transfer
the channel to VFO, change the power, then write the VFO back to
the channel, over writing what was there.

OK, I got it figured out.

First I had to download the latest Anytone programming software. The version on the CD that came with my radio was 1.0; the radio wanted 1.0.1.

Once I had the software downloaded and installed on my netbook computer, I started it and connected to the radio. Next I downloaded the existing profile from the radio (previously programmed in Chirp) into the computer. There is now a column for TX power. The cells in the TX power column were all set for High so it was just a matter of clicking on each one and resetting it, in this case for Med Low. After changing all the power settings, upload the profile back to the radio, all is good, all channels come up with the power flagged as M. Final step was to save the profile to the computer in a new Anytone folder to keep them separate from Chirp files.

From: Milton Hywatt
Topic: 2592 Message: 2595

I'll have to look on my AT software, I think it's v1.0. I was sure it included power settings. I use Chirp for the most part since the AT v1.0 was prone to crashes. My explanation below was for changing the power settings without any software to make it stick. You basically have to reprogram the channel in VFO mode then overwrite it. Best way is just to copy from channel to VFO, change power then write back to that channel slot. My Wouxun KG-UV6Dv2 can be changed to the dealer mode. This way you can go right to the channels and make changes and they will stick. With the Chinese LMR radios they are trying to limit field programming by an end user who may not know what they are doing since people buy these things for business or public service and basically know just how to press the PTT. And all these Chinese walkie talkie makers include models that can't be field programmed. They have 16 channels, no LCD display. So there you have it.

There is a utility program that extends both the RX and TX
ranges. Some radios were sold with USA frequency coverage
only. I'll find my copy and email it to you. All you have to do
is run the software and select frequency range 1 or 2. I don't remember
which one because I only had a look at the utility once. But i think
it shows you the coverage you are selecting.

Not typical but you can download the radio's settings into the Anytone software and see what it's set at. I can't walk you through the process but there should be a list of DTMF settings somewhere in the software. We've also found that toning from the mic is somewhat unreliable. But if you use the software to set up toning sequences it works much better.

I have not worked with the delay but it should be in the software under the DTMF button. My DTMF is useless because it sounds strange and is not recognized by known good decoders. I tried a second microphone with the same result. DTMF codes programmed in the software work in some cases but still are not reliable.

These radios should cover out of the box 136 - 172 / 400 - 500 or something close
to that. Some came from China locked to the USA amateur band. The software utility
will only work on Anytone radios and is right from their factory.

Thanks Milton,
I am a volunteer Fireman and was told that this radio would extend to the frequencies
needed only to find out that it is not even close. Any help would be appreciated.

Sincerely,
Thomas McArthur

Something to try. If you are using the software, select Model, Model Information, and Band 1. In my software, that gives you Tx 136-174 and 400 to 490.

2610. Re: [Anytone_AT-588UV] Re: Delay when sending DTMF from microphone

Yahoo group: Anytone_AT-588UV
Date: 2013-12-27 00:12:35 UTC
From: Milton Hywatt
Topic: 2598 Message: 2610

I think the reason the DTMF doesn't work straight from the mic is audio compression. It probably doesn't compress voice that much but since Anytone had problems right off the bat with the preamp board in the first 50 radios, I can envision this having something to do with the deviation of the tones through the preamp.

Subject: [Anytone_AT-588UV] Re: Delay when sending DTMF from microphone

I have not worked with the delay but it should be in the software under the DTMF button. My DTMF is useless because it sounds strange and is not recognized by known good decoders. I tried a second microphone with the same result. DTMF codes programmed in the software work in some cases but still are not reliable.

Is that the latest software? The utility I have is several months
old. Yeah if the Anytone software v1.01 has it in there then that's
what Thomas can use. That was supposed to be a dealer only utility
like the stun/kill reviver software. I haven't spent any time with these
programs, for months. Chirp does all I want and since all my Chinese
handy talkies are programmed with Chirp I can cross brand import
the Chirp .img file directly from one radio to the other. Some of the
cells and column might not apply but it sure beats the hell out of copy/paste
each row. The rows that don't match the requirements between radios
can easily be edited. Sure beats exporting as CSV then importing that way.
Microsoft Excel botches some exports by adding extra commas. Why?
anyone's guess. But the direct import of the native .img file cross brands
works great. Especially when sharing between 4 different brands like I do.

Look at John Wheatley's comment in this topic just
posted a few minutes ago. He says the factory programming
software has the ability to set the band limits. I'll get a
chance to verify this later unless I pass out in my recliner
like usual. Download the 1.01 version of the software from
wouxun.usa or importcommunications .com and follow
John's instructions. John knows the software as good or better
than anyone else. If that doesn't work out for you let me know.

2614. FOR SALE: Brand New AT-5888UV

Yahoo group: Anytone_AT-588UV
Date: 2013-12-28 02:18:25 UTC
From: <lists@...>
Topic: 2614 Message: 2614

I have a brand new, in the box AT-5888UV for sale. This radio was never used. I took it out long enough to power it up and play with it for about an hour. I also removed the factory power connectors and installed 30A PowerPoles on the radio and the power cable. This unit comes with the remote head cable and the USB programming cable.

Please see the pictures below the actual radio/box and contents still factory wrapped:

https://picasaweb.google.com/113809007504325878104/AT5888UV?authkey=Gv1sRgCJeu-NjK_OLPLQ
https://picasaweb.google.com/113809007504325878104/AT5888UV?authkey=Gv1sRgCJeu-NjK_OLPLQ

I am asking $275 including FREE SHIPPING in the CONUS. I can accept PayPal and all major credit cards. Please email me at sales@rpc-electronics.com to arrange payment or more details.

Thanks!

So the radio is not "brand new in the box" That would mean it was never opened.
And it is a used radio, you played with it for an hour.

So what does this update do or change the radio?

2626. Re: [Anytone_AT-588UV] Default power setting

Doesn't change anything to the radio. Basically computer software update.
has a few things changed on software

Good deal. I'm looking for an easy way to copy my data from my UV6D to my Anytone. Cut & paste doesn't work in the basic software. I'm not to savy with chirp either.

2628. Re: [Anytone_AT-588UV] Default power setting

Yahoo group: Anytone_AT-588UV

From: Todd Bloomingdale
Topic: 2592 Message: 2628

chirp will be the only way to move a uv6d file to anytone format. the anytone software just does 5888uv only. it is actually pretty easy process to do.

in chirp. reaad the anytone radio. once that is done, if you have a saved uv6d file, you can click on file then import. find the uv6d file and move what frequencies you need.

From: Milton Hywatt
Topic: 2592 Message: 2630

If you save both IMG files IMPORT whicg ever way you want to
go. AT - Wouxun, Wouxun - AT. I own both radios and there
are some rows that won't copy because some cells in some rows
don't apply to the AT. So you just open both IMG files and compare.
Then you can make some manual modifications and then re-import.
I always work with a copy of the UV6D IMG file so I can fix which
rows don't copy over. That's the only bummer that if just one stinking
cell the AT template doesn't understand, the entire row doesn't copy
anything. But you will get the hang of it, you just have to hand edit a couple
things then re-import. Usually the amateur rows get copied no problem.
It's the public safety rows that had the problems.

I've found 6 and 10 meters FM pretty useless. I guess it depends on repeaters and anyone else using 6 and 10 in your locale. Around here really nothing for 6 and 10. Now 6 and 10 SSB is a different story. And I do use them with my HF rig. 6 is pretty active in SSB during the summer months. 10, there are a couple local nets. I already own a Yaesu FT8900 and I've never 6 or 10 FM on it. But I'd like to get a look at that TYT anyway.

well, if you like to work 10M FM you have at least 29.6 simplex, which is really quite a kick when conditions are good. Use a decent CB antenna cut down for 10M FM band, and you'd have a decent enough mobile set up...the repeaters are ok, but they get awfully noisy and it's often difficult to carry on any kind of qso on the 10M repeaters...but simplex is the way to go. I've talked to many mobiles on 29.6fm this year and last year during the months when propigation is good...I made several contacts into Japan on 29.6 as well during the japanese 10 meter contest a while back...granted, that was with 100watts and a 4 element beam at 70 feet...but signals were 60 over s9 and I did hear mobiles talking to Japan while I was on the frequency.

anyway, just my 2 cents on the topic.
I'd like to see the TYT as well, and even perhaps a pair of them just had to do it lol.
regards
Colin

I watched the short video. I already own an FT8900 and never use
6 or 10 meters on it except on the rare occasion I talk to the Skywarn
6 meter backbone to the National Weather Service if I'm relaying storm
data or damage from our district. Only a few of us allowed to do that
in our district. If I could get a radio at dealer cost I might think about
it but wouldn't be interested at retail. Also like the Anytone, without USA
support for repair these radios are basically throw away if major problems
appear. It takes long enough if you have to send an Icom or Kenwood out
for repair unless you know someone like I do who sells and repairs commercial
Kenwood, Hytera, and is a 5 minute drive from my home. So it's best you
buy something that can be repaired or replaced domestically or it's not worth
a rat's ass to me.

Hi Milton
It’s a Yaesu Copy in my opinion, the owners manual is almost page for page identical etc
we have just sold out but will have new inventory in again in the next 2 weeks
You know how to find me if you would like one J
Have a happy new year

Best 73s

Got my 'hook' at wally-mart for a few bucks, has a clear self adhesive base and a chrome hook. Want to remove it? just pull the strip, no fuss.

From: Todd Bloomingdale
Topic: 2383 Message: 2637

I took my hanger off my mic. Couldn't stand it swinging all the time. Drove me crazy. Fixed that with a mic button off a broken mic I had. Fit perfect using the factory screw. No more crazy swinging!

2638. Re: [Anytone_AT-588UV] Mic Hook

Yahoo group: Anytone_AT-588UV
Date: 2014-01-01 15:32:47 UTC
From: Milton Hywatt
Topic: 2383 Message: 2638

Yeah that swinging would drive me crazy too.
I have a mount for my smart phone. It sticks
in the dash vent. I use it to hook my mic button into
it and there is even enough room for the phone. So both
are near the top of the center of the dash over the console.

2639. Fwd: [chirp_users] New Daily Build

Yahoo group: Anytone_AT-588UV
Date: 2014-01-02 11:18:28 UTC
From: Todd Bloomingdale
Topic: 2639 Message: 2639

Some added features with the Chirp software for the Anytone.

Thank You Chirp crew for all the work you do!

Todd Bloomingdale- KC9LOX
Tomah, WI

---------- Forwarded message ----------
From: Build System <donotreply@...>
Date: Thu, Jan 2, 2014 at 2:09 AM
Subject: [chirp_users] New Daily Build
To: chirp_users@...

Greetings,

A new daily build of CHIRP is available. This includes changes made directly to the tree yesterday, and may include additional features, bug fixes, and/or bugs. If you are interested in trying it, grab it from the following location:

http://trac.chirp.danplanet.com/chirp_daily/daily-20140102

A list of the changes included in this build (since the last daily) follows:

Changes for Build #255
[Jim Unroe <rock.unroe@...>] [TH-UVF1] TH-UVF1 open image detection fail
add model string for TH-UVF1 V2
related to #1327

[Dan Smith <dsmith@...>] [anytone] Add some more settings:

- APO
- Beep
- Display
- Sub band mute

Kinda related to #661

[Dan Smith <dsmith@...>] [anytone] Add support for power level and a few settings
Related to #661

[Dan Smith <dsmith@...>] Fix anytone frequency bounds

Fixes #1341

[Dan Smith <dsmith@...>] Fix UnicodeDecodeError in repr() of
bitwise string if non-ASCII

Got in my way while looking at #559

[Jens Jensen <kd4tjx@...>] [bj-uv55] more moves bj-uv55 from uv5r.py
to bjuv55.py, fix import errors #1335

[Jens Jensen <kd4tjx@...>] [bj-uv55] refactor bj-uv55 into bjuv55.py,
part 3 #1335

[Jens Jensen <kd4tjx@...>] [bj-uv55] refactor bj-uv55 class out of
uv5r.py, part 2 of 3 #1335

[Jens Jensen <kd4tjx@...>] [bj-uv55] refactor bj-uv55 class out of
uv5r.py, part 1 #1335

[Dan Smith <dsmith@...>] Revert 2156:d0ac18e350d4 that had a
parse error in it.
Related to the patch for #1327

[Marco Filippi <iz3gme.marco@...>] [ft857] Add some settings
structure definition
Implements part of #569

[Marco Filippi <iz3gme.marco@...>] [ft857] Add more settings support
last missing menu settings
Implements part of #569

[Jim Unroe <rock.unroe@...>] [TH-UVF1] TH-UVF1 open image detection
fail
add model string for TH-UVF1 V2
related to #1327

[Jim Unroe <rock.unroe@...>] [TH-UVF1] Error in setting value:
String expects exactly 6 characters
string length of setting did not match length in structure
related to #1329

I think you can just use the regular factory software and select the Model tab and Band 1 for extended Tx.

In the PDF manual I uploaded there is a mistake in the setup.
Where it mentions to enter 108.00 mhz somewhere, where I
forget, change that to 136. You'll have to got to the group home,
select this topic and scroll back in the messages where Don mentions
he made a mistake. I want to give this another try. For now I just
keep the VFOs to the UHF and VHF simplex channel. There are quite
a few that use 146.555 to chat on locally.

It's over the 588 which I don't know of any I've ever seen offered in the US. There are too many basic VHF monoband radio models sold by the big Japanese 4 that are certainly affordable priced and don't have to be shipped back to China to be repaired. As soon as either of my AT-5888UV radios breakdown and I cannot repair them, in the junk bin they go.

Big 4 - Alinco, Icom, Kenwood, Yaesu.

I don't have an accurate idea as to how many manufacturers
are in the Quanzhou, Fujian district where most of these companies
make these cheap handy talkies and mobiles. But a guess would
be in the neighborhood of a dozen. There are maybe 6 other districts
or providences of suppliers so there may be even more than a dozen,
maybe a couple dozen on mainland China.

2650. Jotto Desk Faceplate?

Yahoo group: Anytone_AT-588UV
Date: 2014-01-10 21:09:56 UTC
From: <blackice@...>
Topic: 2650 Message: 2650

Just received this radio for testing in the public service field. Would like to install it in an existing Jotto Desk console.

Anyone know if their is a faceplate that will work? I have 3" of space remaining so it would have to be in a 2" or 3" space.

Thanks!

Rich

Unfortunately when it comes to the AT5888UV you are
on your own. Know info available on a DIN install into the dash.
Piss poor support at best from any dealer at no fault of their own.
You couldn't give me another Anytone radio. Of any kind including
their new HT. It's good as long as it keeps working but you might
as well chuck it in the parts bin when it quits. No domestic service,
no service literature. $130 round trip just to send it back to China
and if you are lucky what you get back might sort of work.

So, would you say, to sum up, that the anytone is a decent enough radio as far as it goes, but not recommended for long term reliable use?
Also, perhaps over priced for what you are getting when compared to other chinese radios?
And I know we're not here to compare brands specifically, but would it be your opinion now that you've had several months to really get a feel for the anytone radio, that it may not be the best option especially considering other brands of radios are in a similar price point, at least with regard to ham rigs?
That said, from a commercial LMR perspective, is it still something that is viable and worthy of note due to it's drastically lower price point compared to other big players in the LMR market? Or, do the failings of the anytone more or less take it out of the running for repair, warranty and reliability issues when compared to other units that do the same thing?
In other words, is $275 worth it for a dual band radio that can be used for commercial or ham purposes worth it based on your findings since you've owned one?

Colin

All I will say is the lack of domestic service makes it
a very undesirable radio in the long run. I've got down
on my hands and knees and begged for service literature
and was rejected. So no for the long haul in LMR, pay the
extra money and buy Kenwood or Hytera. Hytera is a very
friendly manufacture of both analog and digital LMR trunking
APCO25 etc... and I have friends who sell and service both.
I put my heart and soul into supporting the AT5888UV over the
past year and a half but no more.

fair enough.
I think, and this is just personal opinion, that if this radio was sold at a price point similar to how the UV5R dual band HT's are sold, and are truly disposable at $40 and change for a shipped unit, that there would likely be more desire for it...since you could have a few on hand to insure that you always had a working unit etc.
But, given the service and warranty and reliability issues, and the fact that it isn't sold at a price point that reflects true disposability for the north american market, I think it's a flop.
Too bad because it initially sounded like an excellent alternative to some of the very expensive radios out there.
If they dropped the price point down to say $150, I suspect the major issues as outlined here wouldn't be as much of a problem since replacement costs would be low.
Again JMO and cost aside, reliability and lack of service and repair are certainly deal breakers.

And the same goes with this new AT3318UV-A Dual band Anytone HT. After most everyone's experience with the AT5888UV, and still no CONUS service in or out of warranty, @ $125.00 each you'd be crazy to take a chance on their HT. I own a couple Wouxun KG-UV6D and all kinds of spare batteries, hand mic, alkaline battery packs and I really like the radio. But I was told that every Wouxun radio had a flash memory chip
inside that stores your modified settings and channels. That chip in some radios just decides to go belly up and you end up with a radio that won't hold changes after you power it down. They are supposed to be designed for 1 million off/on cycles. Sure you could send it and the Anytone radios back to China. But you do have some risk of it getting lost and the shipping costs for the round trip would be more than just buying
a new radio. So from now on, no CONUS service, no purchase. At least for the Wouxun you can get a schematic and block diagram. So if you find an LMR repair facility like I have at my disposal usually, you may find a tech that will at least look at it.

Only things you can try to do is to replace the cable
between the radio body and the removable panel. But first
try to do a reset to factory defaults. If nothing helps,
it's possible that one of the two ribbon connectors
that connect the mic jack board to the radio removable panel
might have lost contact. You would have to remove the back of
the front panel and you will see that the jack board is separate
from the front panel. And you will see the two tiny ribbon connectors.
You can reseat those by lifting the top latch up and then locking it into
position. You'll need good eyes and a lot of light. Or like I use one of
those magnifying visors. If the radio is still under warranty you may
ask the person you purchased it from to swap it. If they won't you can
either chuck it in your parts bin or contact Qixiang Electronics in China
and send it to them. I think shipping each way will cost you $65 and they
probably won't cover shipping it back. So it would be $130 or there abouts
for shipping. They may or may not warranty. Or they may just send you
a refurbished unit back, hard to tell with them people.

Well I created the group so basically do what I want. I think I told you to forget about a DIN mount or Jotto for this radio. I've checked the removable front panel and its dimensions are about the same as a Yaesu FT8900. As far as my font goes it's set to medium so the HUGE font you're seeing is a problem with what ever application you are viewing the group email with. There, did my reply meet your satisfaction? I switched to the smallest font Yahoo has. And sorry for drifting off topic like we do sometimes. I'm pretty lenient on that and don't rule this group of almost 700 members with an iron fist.

I tried the factory reset to no effect. I'll try a different cable to connect the faceplate with the body to see if that works, and then the other cables you mentioned. I got it from Universal Radio and they are supposed to be a reputable outfit so I'll see how they respond to my email. I would be willing to trade it in for a Yaesu 7900.

Thanks for the advice.

From: Milton Hywatt
Topic: 2659 Message: 2663

So you had no backlighting but does the mic actually work
the PTT and transmit audio? And does the radio receive normally?
If the answers are yes then the 5 volt supply to the RJ45 may be
missing. Just a grab of straws. The mic pinout in the owner's manual
shows which pins on the plug are ground and 5 volts. What disturbs
me is the fail of the radio to communicate with software. I think the
USB to serial UART chip in the cable uses the computer's 5 volts and not
the radio's. While using the radio did it drop, or do you stretch the mic cord?
Again just grabbing straws and some questions I would normally ask with a
basic troubleshooting flow chart. Tell me everything the radio does normally.

I tried the factory reset to no effect. I'll try a different cable to connect the
faceplate with the body to see if that works, and then the other cables you mentioned. I
got it from Universal Radio and they are supposed to be a reputable outfit so I'll see how
they respond to my email. I would be willing to trade it in for a Yaesu 7900.

Thanks for the advice.

No lights or any response on the mike. Neither Anytone or Chirp software can connect to
the radio; both worked fine before. Do I have a bad connector, or did I somehow disable
it?

I finally found a Microphone Hanger Button for my radio. No drilling need. I just removed the 4 small screws on the back of the microphone then removed the screw and bolt holding the mic hanger on the back of the microphone. The new Microphone Hanger Button screw fit in the same hole as the one that I removed. I have added pictures to the site as well as the website as to where you can get one. Price was only$2.99 + S&H.

This exactly what I did also. My button screw was just long enough to put the hook hanger and the mic button back on in case of usage in my other halfs vehicle. But I love the no more swinging and bouncing around of the mic.

2668. Re: [Anytone_AT-588UV] Speaker mike

Yahoo group: Anytone_AT-588UV
Date: 2014-01-12 20:44:19 UTC
From: Dave C
Topic: 2659 Message: 2668

The incident occurred when I connected the programming cable to my computer to reprogram one of the channels. When I tried to upload the new file Chirp said it could not connect with the radio. It would not download, either. I tried the Anytone software with the same result. When connected, the speaker mike has no lights or any other function. Buttons do not do anything, no TX. The front panel lights and switches all work normally and the RX function is not affected.

I tried a different faceplate connection cable and the problem persists. Later today I'll dig up my small screwdrivers and magnifying visor and open the faceplate rear panel; for now I have to take my desktop computer in for repairs as it has gone belly up as well.

From: Milton Hywatt
Topic: 2659 Message: 2669

Factory reset involves power up of the radio while holding
another button or two in. Forget which ones. I need more
info to further establish a possible fault. I do know using
one of the prototype removable front panels before Anytone
added the speaker mic feature when used with a radio that
had a front panel with speakermic, gives the same symptoms
as Dave describes. But the radio worked otherwise. This would
involve the firmware version inside the front panel. This radio
has firmware for the radio body and the removable front panel.
So, if there was an issue with the firmware in the front panel it
could produce the same symptoms.

You may have unwittingly put the radio in a stun or slumber mode
with Chirp. The front panel lives on serial data from the radio base
unit. If some corruption occurred you may have corrupted something.

I put a file that might restore your radio if you managed to stun or kill it
or otherwise in this directory: http://groups.yahoo.com/neo/groups/Anytone_AT-588UV/files/
Windows%20Software/QPS5888UV%20programming%20software/

It's named AT-5888UV SetOsetup_100.exe. Try first to connect to the radio
and read it's version. If it does read the version it may have gotten stunned
or corrupted. This software goes much deeper than a simple factory reset.

Milton;
With the law suit that was just completed and posted here, do you think that Anytone will be more forthcoming with service info since copying appears to be the major concern you indicated earlier.

Thanks, but I can' t get the programming cable to communicate with the
radio at all. I don't think I'm getting the +5 volts on the cable,
either. I opened the rear cover and examined all of the circuit boards
under magnification, and reseated both ends of the short ribbon cable
connecting the main board to the RJ 45 board. Still no go.

Thanks for the help, I guess I just need to wait to hear from the vendor.

I serious doubt it. I think this is just a flash in the pan. Sell as many radios
as you can then move on.

Milton;
With the law suit that was just completed and posted here, do you think that Anytone will be more forthcoming with service info since copying appears to be the major concern you indicated earlier.

Dave, please keep us all posted what finally happens. Hopefully you get a new unit.
73s

On Sunday, January 12, 2014 7:30 PM, Dave C <cavanadd@frontier.com> wrote:

Thanks, but I can' t get the programming cable to communicate with the radio at all. I don't think I'm getting the +5 volts on the cable, either. I opened the rear cover and examined all of the circuit boards under magnification, and reseated both ends of the short ribbon cable connecting the main board to the RJ 45 board. Still no go.

Thanks for the help, I guess I just need to wait to hear from the
vendor.

From: Milton Hywatt
Topic: 2676 Message: 2677

The DB-50M is made by Anytone, uses the same chassis.Only difference, mic and front panel layout.
So it's not a clone It's a wolf in sheep's clothing.

Milton,

ofcourse you are right. But they do differ in firmware programming (a bit).
The DB50M has a specific HAM mode and some menu's are numbered differently
(even in fully open mode). And it does not officially support 108-136MHz
receive (the official software blocks it), but it can receive there anyway.
;)

Wasn't any doubt in my mind that yes there would be some firmware differences. Qixiang is known to customize firmware for the client reseller. Others like Baofeng and Wouxan too. I own a Baofeng F11 that has unique firmware from anyother UV5R. It allows you to lock the radio so you can't field program it. I was reading this from the Chirp-Users list so that may not be 100% correct but that's what one of the Chirp programmers was trying to say I think. And there is nothing wrong with having a specific group for each variation of the AT-588UV. I do allow owners of the variations access to this group. But I usually send them a note up front that their variation may not conform to the AT-588UV programming specs.

Yep it's in the Part 90 model list too. And even in consumer electronics
it occurs. Back in the good old CB radio days when I was doing repair
on out of warranty units, you often saw the same chassis in a Midland,
Sharp, Clarion, Kraco, and then another popular chassis in Cobar, President,
Uniden. After the CB craze died off I was working at a warranty station that
did units from Radio Shack, Circuit City, Kmart, and some others I forget at the moment.

Brands included Panasonic, GE, RCA, Zenith, Emerson, Clarion, Harmon Kardon
Samsung, Gold Star, Tatung, Teac/Tascam, Matsushita, etc... I saw a lot of the same
chassis especially among the Korean brands and off brands like Emerson especially
in VHS VCR units. So it's definitely not an oddity for me or other techs.

2682. Manufacture date

Yahoo group: Anytone_AT-588UV
Date: 2014-01-21 04:58:17 UTC
From: <bscruz@...>
Topic: 2682 Message: 2682

Is there a way to determine the manufacture date of my unit? I ordered it from Ed last October - not sure if I need to use the Pre or Post August 2013 software.

Thanks.

2683. Re: Manufacture date

I believe the newest version of the anytone software will work on all radios regardless of manufacture date. Somebody mentioned on earlier eamil in December. Can anyone confirm?

2684. Re: [Anytone_AT-588UV] Manufacture date

I just purchased this radio used and can't get it to read/write for the life of me. Have installed the software and the usb to com port. I open software and it indeed shows the correct Com port but continually get a COMMUNICATIONS ERROR. I've tried reset, unplugging the programming cable first, loading the software first, etc. etc. So then I tried Chirp and downloaded the latest model. All is get is UNSUPPORTED MODEL error with it. It too shows the correct port. Any ideas?

If the driver for the cable isn't working, that's the error you will get. What operating system
are you using? You may have purchased a cable with a counterfeit chip. The driver will set up
a COM port just like it's working. But not communicate with a counterfeit chip. Take a look
at this site about the chips and drivers. It will tell you what driver to manually install for what
operating system you have. http://www.miklor.com/COM/UV_Drivers.php

I am suspicious of your ComPort install. Suggest you download and run FindComPort.exe to verify port operation. My USB-Radio cable shows as a 'cable without Echo Loopback' under findcomport.exe. What OS? Here is a good source for connect problems:

I have it working on linux and windows 7 without any errors. Linux was a bit of a trick, but that was only cause you have to use chirp and manually point the cable to the right port.

You have a counterfeit Prolific chip in your cable. Like I said the driver will recognize the chip
and set the COM port up but the driver was written not to transfer data with the bogus chip.
But if you roll back the driver build to 3.2.0.0 for Win 7 and 2.0.2.1 for XP the chip will work
fine with those drivers. If you have Windows 7 just leave the cable plugged into the same
USB port. Once you start plugging it into different ports Windows 7 thinks it's a new install
and you will have to manually show Windows 7 what driver to use. I have 3 cables on a 4 port
hub and I leave them plugged in all the time.

2691. Nice radio but the volume control is problematic

Yahoo group: Anytone_AT-588UV
Date: 2014-01-24 17:52:32 UTC
From: <geekorama@...>
Topic: 2691 Message: 2691

So far, really liking this radio (also purchased the base microphone that goes with it) and all the features except one thing. The volume control is terrible! 1/8th on the bottom is completely dead and then WHALAH...sound (more than you typically want in a ham shack in the background at times. I suppose no biggie for the majority who use it mobile. Unless someone else knows a trick, I guess I will purchase an external speaker and install an audio pot cranked way down which will allow me more control. Anyone else know a good work around?

2692. Re: [Anytone_AT-588UV] Nice radio but the volume control is problematic

Yahoo group: Anytone_AT-588UV
Date: 2014-01-24 18:46:46 UTC
From: Milton Hywatt
Topic: 2691 Message: 2692

Yes the taper (virtually non-existent) of the audio pots is problematic with a certain string or build of the radio. I don't know why, but they are not just passive devices in an audio circuit. They are more like encoders in a digital circuit. The removable front panel passes along all data, except for the microphone audio through a duplex serial data encoder/decoder system to the radio at 19.2k baud. All the button pushes, channel changes volumes are all just serial data to the radio, even the on off button. So There may be a way to smooth the taper out with a firmware update but you won't be able to do that on your own. I own one of the first 50 radios sent to the US. But the audio taper is fine. But I have seen others complain. I guess your solution is probably decent. Just make sure you use a wire wound potentiometer for this specific purpose.

2700. Solution for the volume control problem

Yahoo group: Anytone_AT-588UV
Date: 2014-01-28 00:30:30 UTC
From: <geekorama@...>
Topic: 2700 Message: 2700

If anyone has the same problem as myself with a segment of the bottom portion of the volume control being dead (which drove me bat crazy here in the shack)...I found a great solution with this speaker below. In addition to sounding better than the internal speaker, it also has a volume control itself. Fortunately the Anytone doesn't distort as you turn it way up (in fact almost sounds better!) so by throttling down the speaker...it feels normal again.
P.S. I don't sell these speakers or anything, it was just the cheapest off the shelf solution I could find.

From: Milton Hywatt
Topic: 2700 Message: 2701

Only problem I have with that is the max power of only 3 watts. Yes that is 1 watt more than
the radio specs out but it's a loud 2 watts @ 10% THD. Like you said the louder it gets the better it sounds. I've always used an external but neither with a gain pot since I didn't need one.
One is a Workman K-16 which is the best I've found. 15 watts into 8 ohms and a mylar cone air suspension 4" round speaker. 10 foot cord with mono 3.5mm plug. The next, and I don't think
i can really put one before the other is the Barjan Boomer 4" 20 wrms speaker. So if you don't need
the volume control, either of my mention is available and a good choice.

2703. Cloning multiples

Yahoo group: Anytone_AT-588UV
Date: 2014-01-30 03:38:05 UTC
From: Milton Hywatt
Topic: 2703 Message: 2703

Just remove the remote head if it's mounted in a vehicle. Place

the head on your base unit and upload the file you want to the head.
All the memory and channel stuff is stored in the removable head

goes with it back to the radio it came from or any other AT-5888UV.
All the soft pot tweaks and tuning are stored in the flash ram inside
the radio body and have nothing to do with the removable head.

Only serial data sent from the radio body to the head is for the display.

You can only use one plug at a time as far as I know but yes the same USB device provides the data for either style plug. And soon I'll add a third plug for my Yeasu handy talkies. If I wanted to I could add a 4th for the Chinese handie talkies that have two prongs on the plug. I could then pack up the other cables and have just one.

Does anyone know if there is an RF amplifier that I can add to my at5888 in my truck to give me more power out, I am looking for about 100/150 watts out. Thanks

Sure but I don't think you can pump 50 watts into most of them. Most only require 20 watts or so which isn't a problem when you can turn the radio's power out down. But, there is a Mirage amp that will take 50 watts VHF and output 160 watts. I don't know of any dual band amps that are for anything besides a hand held. Those will take 4 watts or soin and put out 45 - 50 watts. If you check with AES or Universal or HRO you'll find something.

Not sure what your goal is, but if it is increased range keep in mind that it takes 4 times the power to double the range. So if you have a 50 watt transmitter and want to double your range you would have to go to 200 watts. Doubling the power would give you about half again the range.

Of course, all that assumes everything else is equal. Usually the best way to improve performance is to improve your antenna (gain and/or height).

The last point to remember is you are looking at 2-way communications, so if you increase your power, the station at the other end of your connection would also have to increase power proportionally (assuming both sides are at the limit of their usable range).

It usually goes for me if I can hear a station be it simplex
or repeater, they can hear me equally well. With a Comet 750
dual band on a mag mount atop my SUV which would be a tad over
6 feet in the air at the base it's not unusual to work one high profile
repeater that is 70 miles away. On the base antenna an AR-270-B
I'm full quieting and a 15 over 9 on the input. It drops considerably
in the mobile even though the gain factors are close for both antennas.
The base of the base antenna is 25 feet off the ground, that makes the
biggest difference. If you are wanting to work simplex with another station
out on the fringe, you both are going to need some power if you want to hold
decent conversations.

2713. Weirdness

Yahoo group: Anytone_AT-588UV

From: Milton Hywatt
Topic: 2713 Message: 2713

Low serial number radio, has Anytone AT-588UV printed on top.
Had forgot to add a repeater the last time I did some shuffling

around. So I was going to do it by hand. Got everything in, 110.9
encode tone to the minus. But when I kerchunked the repeater the
display would not gain the 600 k for the repeater input. Went back
to redo everything and this time I could not get the shift to increase
past 99 using the encoder knob. I could however get it to go the other
way, CCW. So I just hooked it up and entered it in the OEM software and
now the display had the minus above the frequency. I know I got all that right
while making the channel in VFO mode then transferring it to a channel number.

Another point of weirdness is that if you disable the TX on a public safety
channel using the OEM software. I do this because of that gigantic A/B button
in the front of the mic is easy to bump and end you up talking to the cops.

So the tx off feature in the extended menu per channel is nice to prevent that.
But it won't prevent it if the radio is in the cross band mode. It will still transmit

on any frequency except air band or any other frequency designated as AM.

I guess to insure that the radio won't talk past the US amateur limits, the software
used to awaken a stunned radio where you can also select what frequency range

you want would have to be used to limit the TX to US ham band.

And one final notice is not really weird but my Yaesu FT8900 emits a lot of PL tone
on receive. Especially when they are higher like 151.4. Now for some unknown reason
the AT-588UV does not play 151.4 at all even with the 4" external speaker and the
volume cranked. Evidently the AT-588UV limits its RX frequency response out of the speaker
to no lower than 151.4 hz. One reason why I prefer the AT radio for base so I don't
have to listen to those tones. And with the Yaesu they are pretty loud unless you use
the internal speaker and by the size of the speaker, it's not able to reproduce audio
lower than say 200 hz.

I went to install the programming software on a computer the other night. It got to a certain point and said to connect the radio to the computer. I stopped there as I wasn't sure why it wanted me to do this. I'm assuming it's going to download a template/spreadsheet to the computer so I can enter frequency information. Am I correct?
TIA 73's de KD8SST

I don't recall ever being asked to plug the radio in during an instal
of the first or second version of the software.

So what did you end up doing?

If you open the included txt file it will tell you to edit a specific file to disable this. The very first time it wants to verify that you have a radio... After that it doesn't care.

So by editing the file it bypasses this step

Not the same. The software will ask you to plug a radio
in if you try to open it for the very first time without a
radio being plugged in. From the original question, the
software was in the process of installing when it advanced
to a point and asked for a radio to be plugged in. Now I
do not recall being asked for a radio during install of
version 1.00 or version 1.01. They may have made a change
in version 1.01 to where it asks during the install if you have
not previously installed version 1.00. That's the only thing I can
think of is that on my PC it saw 1.00 there so it didn't ask for a
radio when it was installing. Anyway I still want to read what
KD8SST actually did when asked to plug a radio in during install.
And what version was being installed.

So did you abort the install or did the software finish installing?

If it installed and you try to run it for the first time it will ask for a radio plug in. I've never heard anyone being asked for the radio during the install process. And it never asked me.

Subject: Re: [Anytone_AT-588UV] Programming

So did you abort the install or did the software finish
installing?

If it installed and you try to run it for the first time
it will ask for a radio plug in. I've never heard anyone being
asked for the radio during the install process. And it never
asked me.

Ok. Well if you need some help in the future try to be
a bit more descriptive. We here like lots of information
because it's hard to help people when you have to drag
information out of them like I have with you.

Good luck and enjoy the radio.

You said "I stopped there because I didn't understand why it wanted me to do this" No biggie I'm just trying to soak in
what happened. I've been doing IT work for a living since 1998 and have
installed thousands off operating systems, server and workstation applications
for Novell and Windows. It's just the way I try to get to the bottom of problems. So I wasn't sure if you had another computer you were installing on and you just switched the monitor off and came here asking what to.
I guess when you get the cable driver properly installed and the radio nearby being able to power it up you can try again. Don't know if the software looks at the list of COM ports and checks for a radio on each one, it must. But the normal way is install cable driver and make note what COM port it uses. Open the program with the radio plugged in then in the software setup select the COM port.

Well Doug you can set the radio up now. That way if you run into
problems you can get them ironed out before you go on the air.
Also I ran for almost a year a Diamond SG-7500 dual band NMO
mount on a magnet up in the attic planted in the center of an old
massive metal office desk I am storing there. And the antenna is
still there and on my switch box for VHF/UHF in the shack. I've since
about 2000 install a Cushcraft AR270B for 2 and .70 meters. And
a Cushcraft Ringo for 6 meters. Already had a quad band HF vertical
covering 10 meters. Bought a triplexer to turn one connection to
the back of my Yaesu Ft8900 quad band into 3 different antennas.
If you've got an attic, something metal up there and can run some
RG/58 down to the shack, and a mag mount dual band antenna
you can get on the air without waiting for the weather. I still am
impressed with that SG-7500 sitting on that big honkin metal office
desk. 50 mile simplex on 5 watts is common. A bit of noise in the back
ground but perfectly readable. A Switch to the AR270B and 50 watts
gets me a 40 over 9 to most within 50 mile radius. I'm also at about
1280 feet above sea level depending on the barometer. So the elevation
help out.

Hope I've helped you out so far. Sit back and enjoy the QSO's here.

Milton

From: <jon@...>
Topic: 2731 Message: 2731

I just received an at-5888uv used from radio-mart (who I'll never deal with again but that's another story).
Among other things, the promised programming cable was missing so until I get one, I was hoping to edit the existing memories (frequencies, get rid of the alpha numerics) and set up some new ones. It didn't come with a manual and something I found online doesn't really cover this. I tried downloading the manual from the files here but my 7-zip says the file (s?) are damaged and won't extract. Is there somewhere where I can find out how to do some of this stuff without the programming software until I get a cable?

Thanks,
Jon
W7VH

All programming is done in VFO mode. Then you write the vfo to a channel.
Use side A, the left side as it carries all the bands the radio covers. You can do a revert to factory condition by holding the Right side SCN button while turning the radio on. I'll email you the current owner's manual to your personal email address.

Milton, group owner.

Hi,

Sorry if I missed this covered somewhere, but just plugged in my 588. I can't change / lower the left volume. Turning the knob turns off the display - but not the radio. Turning it back 'on' the display acts as if it's powering up - says ANYTONE" and beeps, but audio is still coming from the left receiver.

Any suggestions?

Thanks.

You probably haven't missed this being covered because it's the first time I've seen this. Only thing I can suggest is a reset. Hold the right side SCN button with radio off then power the radio up. This will wipe the channels out too so make sure you've got a recent software copy.

Hmm.. this is a brand new unit, so no worry about lost channels. That doesn't seem to work. At least I see no confirmation of resetting it. I do see all LCD segments light up, but the vfo's I was in are maintained, and still same problem :(

The illumination of all the led segments is confirmation of a reset.
And the VFOs start out at a certain value according to
what band you are in. I'd contact who you bought the radio from and
make them exchange it. It looks like it has some serious bugs. All the
controls on the remotely mountable control head are converted to serial
data. So basically everything you can turn are encoders. The data is
fed to the body of the radio via a duplex serial data signal at 19.2 khz
where it is read and converted back to data the radio can use to turn
the volume up and down, set the squelch, channel, etc... In return the
radio sends data via the serial link back to the LED readout to illuminate
the background and to show the LED segments. The only analog signal
not sent to the radio via serial data link is the microphone audio. So I
see a problem there somewhere. The control head MPU not interpreting
things correctly. Maybe a faulty firmware flash from the factory. There are
two firmwares in the radio. One in the control head and one in the radio body.

Ahh yes - I did notice the VFO's were reset (i thought I changed them and after the reset thought they stuck but they didn't). Yep, retruning it to Amazon.

Hopefully the next one I get works!

Thanks.

This serial data stuff is no stranger to the radio world.
The Yaseus of the past decade have used it so the control
head can be separated from the radio body. And you would
need a separation cable with 30 wires inside to transfer input
from the remote to the radio body. This was they can use an
8P8C (RJ45) and 8 wires to do it. On my Yaesu FT8900 the use
an RJ11 which is a 6P6C modular connector with 6 wires. On my
Alinco DX-SR8/T HF rig they use an 8P8C. I just use a CAT5 cable
to separate the head from the body. Saves space on my desktop.

Your radio is the first I've seen with severe problems. Usually there
are bugs that can be worked around by various methods. Some radios
were made with poor quality ceramic filters allowing a lot of adjacent
channel interference. I've verified this on the first AT5888UV I bought
using a General Dynamics R8000 communications analyzer. And because
the radio from end amps are so strong using anything besides a unity gain
mobile antenna in an RF saturated area could get you some intermod
distortion. That's the radio RX going non linear and allowing strong signals
from a harmonic to bypass IF filtering and downmix with the wanted signal
without being rejected. My radio was still detecting a tone from the R8000
at -127dBm . The R8000 only goes to -130 dBm which is basically no signal.
A decent strong signal is around -60 dBm.

I use my #2 5888UV in the mobile every day. #1 is hitched to a Cushcraft
AR-270B via 75 feet Belden 9913. I use it instead of the Yaesu which is on
a 6 meter AR6 right now. I've got great audio reports on the 5888UV where
the FT8900 you have to get right up on it to get decent tx audio. I've been
wanting to check that on the R8000 and possibly adjust it. FT8900 has a service
mode where you tweak rx and tx through the buttons and knobs on the front.
I wish I could get some service literature for the 5888UV but the maker formally
denied me in email. I just hope these radios work for several years or more.
No domestic service, no service literature = in the junk box if serious problems
occur. Good luck with Amazon. They've always been good with me.

Yes I agree with you Milton on the service manuals. Its crazy that there is several variations of the 5888 and they still seem to think that their radio is top secret. Is this their sales plan tactics of if it breaks they will buy more? I'm thinking not. I sure hope they figure it out.

I think that the variations are all manufactured by Anytone. I do know
however there was some infringement of copyright going on in China.
And the Anytone people were trying to sue another maker. And they also
warned that they would come after anyone in any country selling or servicing
these radios. What those are I don't know but I do know if you look at their
FCC part 90 application it lists all the model names they would sell that would
have the AT5888UV chassis. , Now these could bear a custom firmware but
basically the same guts. Similar to the old CB days where you could find a
Uniden chassis in a Cobra radio, or Uniden radio or the President. Another popular
CB chassis was one that used the PLO2A PLL chip. It might be in a Krack, Midland,
Royce Radio Shack, etc...However I think that the manufacture just made the chassis.
It was up to the various manufactures to design the covers and the escutcheon,

mic. etc... Not for the Qixiang (Anytone) company though, I'm fairly certain the

radio from top to bottom they made in their facility.

2743. El-Cheapo wiring and connectors.

Yahoo group: Anytone_AT-588UV
Date: 2014-02-23 02:48:54 UTC
From: Milton Hywatt
Topic: 2743 Message: 2743

I had been monitoring the sub display of the AT5888UV

in the voltage mode. 14.40 volts on RX and on 145.520
TX volts dropped to 11.85 volts. Wow that sucks I said to myself.

I have been running the radio on a 40 amp continuous supply.

However the main rear terminals were attached to my HF rig.

The front two powered the Anytone but the oulet was rated at ten amps.

Ok my fault. Unhooks the HF rig and hooked up my high current MFJ 1118
high current distribution bar to the pwer supply 40 amp output terminals.
Now at the very begging 35 amp total output bus where the HF and AT5888UV
are attached to their own banana style terminals I measure the voltage drop at
 the source to be about 300 millivolts on VHF TX. Much better there. However feeling
the radio side of the modular power connecter up to the fuse, the power cable was
warm to the touch telling me there was some voltage drop. Sure enough at the radio
side of the power jacl voltage dropred from 14.4 volts down to 12.4 volts. This was
tested with a Fluke 77 DVM. I grabbed the power connector in my left hand and

squeezed it and the cables on each side of the connector together hard, key'd the mike up
and now had a voltage drop of 1 volt down to 13.4 volts indicated on the Fluke. The
remainder
of the loss is from the gauge of the wire. 13.4 isn't bad for TX and should guarantee full
output. I guess I need to pull the wires from the plastic, solder the wires to the
connectors,
then squeeze the female connectors together and see if that corrects the connection issue.

If not I will just change out the connector adding heavier cable. I like to see as much
voltage and current for TX as possible. At 13.4 volts at the fuse the radio puts out 60
watts
on VHF and 45 on UHF. Yeah I know some might argue that isn't a big difference but it's
enough
especially on a fringe simplex contact.

Keep in mind that there is some drop in the Fuse and Its holder
contacts. The fuse has to have some resistance in order for it to heat
and melt the link. Note that 120 volt fuses are generally different
from low voltage automotive fuses. Auto fuses do not have to break the

high 120 volts associated with the current and generally use a different fusing metal in the link. The bottom line is that low amperage fuse's give better protection than higher current ones as the cost of additional voltage drop whereas high amperage fuse's have less voltage drop but will allow higher currents to flow and consequentially, more likely to damage your equipment.

2745. 'upgrade' yaesu 8800 to anytone and mic question

Yahoo group: Anytone_AT-588UV
Date: 2014-02-23 07:23:37 UTC
From: Evan Platt
Topic: 2745 Message: 2745

So I'm looking to upgrade my vehicle radio from a Yaesu 8800 to a Anytone. It's a remote mount. So question is - is the seperation cable the same from the Yaesu 8800 and the ANytone? If I recall the Anytone is a normal LAN cable - is the Yaesu 8800 the same? How about the 'power' cable connector (rat tail from the radio)? Are they both the same? Will this basically be a plug and play swap?

Lastly, is there a 'normal' mic for the Anytone - ie can I get a off the shelf commercial say Vertex commercial mic? I like the look of a regular old mic, not a DTMF mic, something like

http://www.rfwiz.com/images/VertexStandard/Accessories/MH-25A8J_270ph.jpg ?

Thanks :)

Well, the Yaesu is already installed in the car, with the head on the dash
and the base unit under the seat, so would save me having to run the wire
if the existing wire works :)

I don't have an 8800, but a quick google shows me that the 8800 seperation cable can be just a regular network cable. The power receptacle on was a standard VHF power connector. The lady at our candy store grabbed me an extra plug out of the bin and I wired it to a power pole set to plug into the 4-way splitter I have under the dash. So in theory, yes. This should be a swapout of body and head units for you.

I realize the fuse will be warm. And there are 3 fuses from the 35 amp
buss to the female modular connector. Since the two fuses are really there
only to protect the cable if it shorts inside the vehicle engine compartment

those can be eliminated on a base rig. The power supply has a short circuit
crowbar anyway. The single fuse on the radio didn't feel warm. And I was

measuring voltage drop before the fuse at the radio side connector. And I've
since soldered the crimped ends of the spade connectors inside the plastic
on both sides. Now there is no voltage drop across the connector. Also soldered
the crimp on fuse clips. Any drop at 12 volts means you have less push for current
so it's critical at low voltages you have as little drop as possible. This is why
large gauge wires are used the large the amperage draw, the thicker the wire.

Personally I thing the wire gauge is inadequate. My MFJ DC 50 amp outlet strip
looks to have 6 gauge wire for its source. It has a built in volt meter and it doesn't
budge with a 100 watt CW carrier and a 50 watt carrier from the AT5888UV

when both are keyed simultaneously. The ammeter on the supply shows 35 amps.

So at least for the base radio I'm going to double the gauge of the wire, eliminate

the quick disconnect and replace the fuse holder with a plug in type. Those are
true 12 volt fuses. There isn't a thing wrong with wanting the radio to see 13.8
volts where it end at the radio main board inside during transmit.

Subject: Re: [Anytone_AT-588UV] El-Cheapo wiring and connectors.

Keep in mind that there is some drop in the Fuse and Its holder contacts. The fuse has to
have some resistance in order for it to heat and melt the link. Note that 120 volt fuses
are generally different from low voltage automotive fuses. Auto fuses do not have to break
the high 120 volts associated with the current and generally use a different fusing metal
in the link. The bottom line is that low amperage fuse's give better protection than higher
current ones as the cost of additional voltage drop whereas high amperage fuse's have less
voltage drop but will allow higher currents to flow and consequentially, more likely to
damage your equipment.

If I recall the Anytone is a normal LAN cable - is the Yaesu 8800 the same? How about the 'power' cable connector (rat tail from the radio)? Are they both the same? Will this basically be a plug and play swap?

Lastly, is there a 'normal' mic for the Anytone - ie can I get a off the shelf commercial say Vertex commercial mic? I like the look of a regular old mic, not a DTMF mic, something like

http://www.rfwiz.com/images/VertexStandard/Accessories/MH-25A8J_270ph.jpg ?

Thanks :)

How is your SWR ? The fan is temperature controlled
and during normal operation even at 25 watts you can
expect the fan to turn on automatically. And yes the power
does drop as the output MOSFET reaches 160 degrees F.
So check your SWR and coax and connectors. I own two
of these radios and one I put it through a transmit torture
text. 1 hour dead key 55 watts into my HF non reactive
oil filled 1000 watt dummy load. I put a refrigeration
thermometer with a 200 degree F limit in the middle of the
heat sink. At about 160F the power dropped to 35 watts.
And it stayed there for 1 hour. Only fan was the built in fan on the back.
The heatsink has a large surface area and can handle the heat
but if you've noticed a change, better check SWR coax connectors antenna
etc...

I can remember for certain but the only situation
where the fan runs all the time is when you first key
up the radio in cross band repeater mode. Before I mounted
my radio permanently it sat on a rubber mat on the dash of my SUV.
And of course that gets pretty warm and the fan will come on when
the radio warms sufficiently from the sunlight.

My Yaesu FT8900 seems to be on a timer. It starts running as soon as you hit PTT
Stays on for a minute or so but it may stay on longer if the radio is warmer.
So if the heatsink is say 140F it stays on for 3 minutes where at 80F it stays on
for 1 minute.

Well if you get frustrated installing a driver and then seeing what COM port
it emulates, I can't image how frustrated it will be to manually program the radio.
If you just aren't that savvy with a computer maybe you might enlist the help of
someone who has more experience ? I only say that because I have been using
computers for more than 20 years and it does take some patience sometimes.

That's because computers made specifically for Windows 8 are moving to
a UEFI or EFI not unlike Apple went with their Mac products. However the
same Prolific driver that works with Windows 7 works with 8. This particular
person happens to be using XP. And the complete illustrated instruction
on installing the driver for XP are at www.miklor.com. Like I mentioned before
I've been around the PC, diskless workstations, dumb terminals for a long time.
Also radio repair. And before anyone heard of ethernet and IP, way back it was
Arcnet, TCNS, Banyan Vines, And some Xerox networking schemes over coax
and serial data flat NTP cable. So I've already lived the frustration. And I would
recommend to anyone that if you are frustrated, shove it aside for another day.
Things never got fixed when I was frustrated.

2770. Horrible intermod on 588.

Yahoo group: Anytone_AT-588UV
Date: 2014-03-01 04:37:47 UTC
From: Evan Platt
Topic: 2770 Message: 2770

Hi All,

So finally got a working 588, but the intermod is HORRIBLE.

I have a number of public safety frequencies I monitor - mainly in the 150's.

They all have TSQL, Antenna is a rooftop (house) antenna.

Even with the PL, I'm getting horrible intermod - sounds like the old POCSAG paging systems. This is when there's NO audio on the channel (ie it's not during receiving regular traffic).

Is there a fix for this?

Please don't tell me I have another bad unit...

2771. Re: [Anytone_AT-588UV] Horrible intermod on 588.

From: Todd Bloomingdale
Topic: 2770 Message: 2771

Evan,

Are you using software to put these frequencies in? reason asking, you mentioned that you put in pl tone. If you are using the software with pl tones, on the channel in software, if you have a receive pl tone you need to click on the double >> under the more tab. This will bring you to another setting screen. at Squelch mode: if you have a receive pl tone, change the drop down to ctcss/dcs then click ok. this will activate the receive pl tone feature. Hope this helps.

Topic: 2770 Message: 2772

Make sure the tone squelch is on. In the QPS software the
last column with >> in the rows double click and choose
12.5khz for channel spacing, CTCSS/DCS Decode - CTCSS
with the correct to to the right, Squelch Mode CTCSS/DCS,
and up at the top right choose TX Off to prevent you accidently
transmitting. Also make sure you are not using RF squelch, it
sucks. These receivers are hot, up to -127 dBm rx. And add
an iffy front end and IF filtering and you will get intermod.
Also monitor the public safety frequencies on the right side
of the radio, it uses a different IF mixing strategy. Most of your
text paging transmitters are in that zone where if you are in
a RF saturated environment, some of these transmitters create
transmit spurs that the radio just doesn't filter out properly.
I've got a Cushcraft AR-270B 40 feet up with Belden 9913
feeding it and don't get any intermod. Not on the radio that was
#39 off the production line or the radio that was #289. Try
Todd and my advise. At the bare minimum if you use CTCSS decode
and it is switched on, you won't hear the POCSAG if you only
hear it when the channels is inactive.

Subject: [Anytone_AT-588UV] Horrible intermod on 588.

Hi All,

So finally got a working 588, but the intermod is HORRIBLE.

I have a number of public safety frequencies I monitor - mainly in the 150's.

They all have TSQL, Antenna is a rooftop (house) antenna.

Even with the PL, I'm getting horrible intermod - sounds like the old POCSAG paging systems. This is when there's NO audio on the channel (ie it's not during receiving regular traffic).

Is there a fix for this?

Please don't tell me I have another bad unit...

Subject: Re: [Anytone_AT-588UV] Horrible intermod on 588.

Make sure the tone squelch is on. In the QPS software the
last column with >> in the rows double click and choose
12.5khz for channel spacing, CTCSS/DCS Decode - CTCSS
with the correct tonenumbers to to the right, Squelch Mode CTCSS/DCS,
and up at the top right choose TX Off to prevent you accidently
transmitting. Also make sure you are not using RF squelch, it
sucks. These receivers are hot, up to -127 dBm rx. And add
an iffy front end and IF filtering and you will get intermod.
Also monitor the public safety frequencies on the right side
of the radio, it uses a different IF mixing strategy. Most of your
text paging transmitters are in that zone where if you are in
a RF saturated environment, some of these transmitters create
transmit spurs that the radio just doesn't filter out properly.
I've got a
Cushcraft AR-270B 40 feet up with Belden 9913
feeding it and don't get any intermod. Not on the radio that was
#39 off the production line or the radio that was #289. Try
Todd and my advise. At the bare minimum if you use CTCSS decode
and it is switched on, you won't hear the POCSAG if you only
hear it when the channels is inactive.

So sorry! But I did NOT suggest that he should buy another brand of radio, I simply mentioned what my solution was to eliminate the horrible intermod I experienced with the AT5888UV that I owned. Simply put, he is not the only owner that has experienced intermod with that model radio. When I still had my AT5888UV nobody could offer any other fix or solution for the problem other than to return it. If there is a workable fix for the problem, please tell us what needs to be done to fix it? Otherwise I found the AT5888UV to be a great little radio at a nice price. It just didn't work for me. I thought this forum was intended as a means to share information and experiences, maybe I was wrong.

Your message was blunt, curt and to the point. Get a refund
and buy a Kenwood. This group is for technical assistance for software
and radio. And I've suggested sending the radio back to the dealer
for an exchange. Even with this owner Evan. His original radio rebooted by just
turning up the volume. But I didn't advise him to get a refund and
buy a Kenwood, problem solved ! If Evan is getting intermod but only while
the channel is otherwise inactive and the channels uses at least tone decoding
he can get rid of the intermod by making sure his tone decode is on for the channel(s)
where it's a problem. That will get rid of unwanted signals. And usually the receiver
will reject intermod in the presence of a valid signal. I use tone decode on the 4 public
safety channels I listen to. Just to get rid of their repeater ID which is not transmitted
with an encoded tone. The advantage here being the mobile and portable units don't
have to deal with the traffic of listening to 10 to 15 seconds of repeater ID every 15
minutes
or less. So when I offer a solution or workaround I try to explain my reasons behind them.
And I had my first Land Mobile Radio repair job before I had an amateur license so I do
feel I know what I'm talking about. One of my friends who sells and services Kenwood
and Hytera LMR and trunking LTR, Smartzone II APCO 25 CA, installed communications
towers etc.. had a talk about these Anytone radios. Especially after I brought one in
and tested the receiver on a General Dynamics R8000 communications analyzer.
His opinion was a hasty design, poor internal component layout and shielding and
parts testing and quality control. I think it is the quality of parts. Filters that should
be
narrow being not so narrow but installed anyway. If this radio just did 136 - 179
and 400 - 490 mhz without the air band, 220, 350, 800 I think it would be much
more stable. Once I saw this radio could pull out a tone generated by the R8000 down to
-127 dBm
I knew there could be an issue with intermod especially in areas saturated with RF
especially their harmonics. But I also know from experience there are ways to work around
these issues other than get a refund and buy a Kenwood.

Milton, your fearless leader.

Tone decode only works if the repeater passes pl tones or generates its own pl tone. In my case the intermod was there with or without a signal present and the repeaters I use do not pass pl tones so tone decode was no help. I have re-read my original message and I did NOT advise him to buy anything! I simply stated that I did so.

Did you get control of your intermod ? Just wanted to see if any
of our suggestions worked. I'm assuming yes because you say
you might buy another. I had to give someone the boot from this
group for arguing with me off list about intermod.

Oh and I don't care much for the stock mic either. They really overdid it.
Gigantic A/B button that you can hit while you're conversing. Like I did one
evening and ended up on the local police repeater output. Luckily I wasn't
using tone encode so nobody heard me. And I just happened to be signing
off and gave my call and name LOL. So I shut TX off on the public safety channels.

If you were looking for a number 2 radio, do you still not have the FT8800?

Well, not sure if it's really Intermod or just another station on the same frequency from far away. I don't hear it on my HT, but the AT is using a 40 + foot rooftop antenna.

Since most of my frequencies use rx pl, not a big issue.

I do still have the 8800, so I may put that in the house , so not sure if I'll end up buying another AT or not.

Well POCSAG transmitted around here are all below the public safety
band like around 140.000 - 149.000 . And you really can't mistake
the signaling either. If you use RX PL and the interference is far
enough away then it shouldn't interfere with your locals.

2792. Revert to on with power?

Yahoo group: Anytone_AT-588UV
Date: 2014-03-07 07:00:14 UTC
From: Evan Platt
Topic: 2792 Message: 2792

So I will shortly be replacing my Yaesu 8800 in my car with the 588. Right now, all 'accessories' in my car run through a power unit to a second battery. Once the engine is shut off, accessories (scanners, etc) run for 30 minutes, then power is shut off. (there's a button to extend the timer if needed). Then when I turn the car on, the power is restored and that second battery is charged.

What I like about the 8800 is I generally leave the 8800 on, and then shut off the car. The 8800 is obviously turned off when power is cut, and then the 8800 comes back on with the power when the car is turned on. Right now the 588 is in my house run on a DC power supply. If I leave the 588 on, turn off the power supply, then wait and turn the power supply back on, the 588 remains off. Is there a setting somewhere to basically have the 588 'remember' it's last power mode and turn back on?

Thanks :)

Go to this link. About half way down is the programming software.
http://www.wouxun.us/item.php?item_id=295&category_id=64

As for drivers for the programming cord go to this link.

I have two 5888s in service- one in my auto and one in a fixed location as a XBand repeater. Both radios automatically power up when 12V is applied IFF the radio was ON when 12V power was removed.
Both radios have Hyper Channels Programmed but I do not know if this affects the power up action.

There is an accessory you can buy, look in the owner's manual.
I think it has a cig plug on it and it plugs into the back of the radio.
It needs a switched power source, an outlet that shuts off. But when
power is applied to the accessory the radio will turn on. My two At588UV
radios will most of the time turn back on if you cut the power while they
are on and then restore power within a certain time. I don't know how long.
But look in the manual about half way through there should be a list of accessories.
I think the plug just provides wherever it plugs into with 12 volts but don't quote me on
it.

My radio does it intermittently. Sometimes it turns on when i start the car and sometimes it doesn't. Doesn't really matter to me because I have mine set up with a passcode before you get started anyway.

If the light is LED the radio might have enough current to power it.

Because that is how the radio is designed. You want to argue
why, I'll give you the email of the manufacturer in China and
you can ask them why. I'm just telling you that the frigging radio
has that option via the optional QCC-01:

Page #4 of your owners manual:

Without QCC-01
When the ignition key is turned to ACC or ON(Start) position
with the radio turned off, the power switch illuminates. The
illumination will be turned off when the ignition key is turned
to the off position.To turn on the unit, press the power switch
manually while it is illuminated. (While ignition key is at ACC or
ON position)

With the QCC-01 cable installed

When the ignition key is turned to ACC or ON position with the
radio's power switch on, the unit turns on automatically and the
power switch will be lit. Turn the ignition key to OFF position or
manually turn the power switch off to shut down the radio.
Using extra cable,power consumption:5MAH.Without this function,user can turn on/off radio
by Power knob

Oh. I totally missed that in the manual. That's umm... crazy.

Is this a standard cable? ie straight through, and likely one I have lying around the house? If so I probably have a regular old DC cable to plug into the charger.

Crazy design :)

Umm.. .LOL.. I'd prefer someone who's familiar with that cable advise
before I possibly go and fry my $300 radio :)

I had done some google searches but didn't find much information.. I looked at one place that has it for sale and it says "This isn't a power cord", so not sure if that means it's not a cord that passes power, or just means it's not used to POWER the rig. But it's only $10 so might as well get their cord...

From: Milton Hywatt
Topic: 2792 Message: 2810

I created this group Evan. In 2012. And owned the 39th radio to touch
US soil. When I tell you what this accessory does I'm not guessing.
It is not a power cable. It is a cable that sends a voltage to the ACC
port on the back of the radio. This turns the radio on and off without
intervention from the operator. And it does rely on the fact that where
these cigarette plug end is plugged into switches on and off. My vehicle
has both cigarette lighters and ACC sockets. And both stay on when the
vehicle is off so the plug would do me no good. I would have to figure out
the amount of voltage the cord provides and make my own substitute.
So those are the conditions the ACC cord work under.

thanks for the info.. Not sure if it's worth getting, although it would be nice to have the radio power on and off with the ignition, it just seems silly. That's the first radio I've seen that has this setup. Wonder what the logic behind it is. :)

Great radio, just has its quarks, but overall I like it :)

I don't have much use for it. Generally I only shut it off when

I park the SUV for the evening. That .2 am idle draw is nothing for

a 1000 cold cranking amp battery. This winter we got some days in a row
in the minus 5 degree area and the last was 16 below. And when I start the SUV

the lights come on while it's cranking and if you left the blower on that comes on
but at least it shuts off while it cranks. The 290 HP inline 4.2 liter 6 fires on about
the third go around even below zero but that battery really spins the motor when
it's cold.

And I suppose the logic behind the radio coming on automatically is when it is in
use for business. That's where it would be most useful to have the radio on at all
times the vehicle is running. I don't find that kind of importance in amateur use.

I do have it set up with a 4 digit passcode you must enter at power up. If someone

steals the radio they'll have fun trying to figure out the code. And who knows, after
trying
for a week they may just bring it back, you sure couldn't sell it if it won't get beyond

ENTER PASS

LOL!

thanks for the info.. Not sure if it's worth getting, although it would be nice to have the
radio power on and off with the ignition, it just seems silly. That's the first radio I've
seen that has this setup. Wonder what the logic behind it is. :)

Great radio, just has its quarks, but overall I like it :)

Well I have a number of radios and other electrical gizmos that always draw phantom power, hence the second battery :)

Well my question was more why not just make it 'default' or make it an option you can enable or disable? Plenty of other equipment operates this way - every scanner I've had, my Yaesu 8800, other mobile's I've had, my FM stereo (aftermarket) ... I don't admit to being a electrical expert, I just wonder what the 'second' power cable does (ok - even if it doesn't supply power, I'm calling it a power cable for lack of a better term) - what does this do that can't be done with the regular hard wire cable?
The way I see it, correct me if I'm wrong.. a regular power cable (hard wire to battery), the radio loses power when the igniton is shut off.

This additional cable ALSO loses power when the ignition is shut off. So in essence, you have two power cables?

Yes both lose power. But applying power to the ACC port on the radio
turns the radio on (not sure if it shuts it off too) and just applying DC
to the mains of the radio doesn't insure that it will turn on. Some have
said that iff you remove power with the radio on, the next time you apply
power, the radio will turn back on. I have experienced this in both the Anytone and the
FT8900
but not consistently. So the ACC cord is to make sure the radio powers up
when the vehicle's key is turned. Oh and one final thing. The radio is to
be supplied directly from the battery. Not an on/off source. So this way
you would need the ACC to turn on and off with the vehicle to turn the radio
on. Make sense now?

2815. CTCSS level change with selected xmit freq

Yahoo group: Anytone_AT-588UV
Date: 2014-03-11 13:27:03 UTC
From: Bill Cordell
Topic: 2815 Message: 2815

I have a problem with the CTCSS (PL) level dropping to below 300 Hz deviation on a couple of 450 repeater frequencies. Move to talk around and the deviation jumps back to close to 500 to 600 Hz deviation. Has anyone had this problem ?

Thanks

Bill

Some radios have an issue with PL deviation when using the DTMF pad.
PL encode set in the signaling section of the radio's memory seems to fare
much better. Of course that doesn't help much if you are looking to tone
a repeater controller to control it. If the manufacturer would send me some
service literature there probably is a soft pot adjustment for this but no dice.
I've offered them to sacrifice my first born child to Xi Jinping but still no service
info.

2818. Mobile antenna suggestions

Yahoo group: Anytone_AT-588UV
Date: 2014-03-11 19:01:27 UTC
From: jasedude2003@yahoo.com
Topic: 2818 Message: 2818

I am a happy owner of my Anytone radio. I am not a ham, but rather use it for public safety in my patrol car. I originally purchased a dual band mag mount antenna which was 0 dbi on vhf and 2.5 dbi on uhf. I have found that unless I am within 5 miles and have a visual on the repeater for vhf I am unable to open the repeater. I am getting a lot better results on uhf.

I work in a hilly area near Death Valley California so distance and coverage with hills is important.

Any suggestions on a good magnetic mount antenna? I found several which have great gain, but am trying to avoid having an antenna which is more than 40" tall.

Thanks in advance for any input or suggestions.

Jason

I use a Diamond SG7500 on the HAM bands and it is a clear improvement over the noname little magmount I had. Bear in mind though that on VHF and UHF you need a more or less line of sight to the repeater.

I'd suggest the Comet 750 A but it's 42 inches. It's also got a very sturdy UHF connector and the antenna pulls up and folds over at the top of the coil. I own the 750 A and the Comet magnetic base. It's a real performer. People often ask me if I'm mobile or base. Now there is also the dual band HP-32FHN that's 35 inches tall. Don't know anything about how well it works other than it has similar gain as the 750 A. If you are going to be talking in the public safety bands then you will need a wideband antenna to cover ham also. Not sure if Comet makes one but I know they are out there.

I'm using a Tram Dual Band antenna (Tram 1181 NMO VHF / UHF 144-170 / 430-470 MHz) on a NMO Trunk mount for mine. If you are having with receiving VHF I would have to guess that there is an antenna issue and just have been "lucky" with you UHF side. Off the top of my head I would say that it's a antenna ground issue. My Anytone works extremely well on both bands. I've attached a pic of my set up for you to look over. And lets be careful out there Jason! We have had a bunch of PD involved shootings over the past two weeks here with one Phx officer being killed.

If your wanting a dual band wide antenna for Public Service Band, look at the Comet CA-2X4SR. I have a roof mounted NMO mount version but they also have a PL-259 version. This antenna works great on both amateur radio and Public Service Bands and I love it! It is 40 inch tall, so it's right at your limit. I will say that this antenna has very nice gain on both VHF and HF and it pulls in and throws nice signal. I couldn't be happier. It also has the fold over feature Milt mentioned. The only downfall I will say is if your going to use this antenna on a magnet mount, you better find a heave base, as this antenna is very rigid, so a good base is advised.

Ah yes that's the one I couldn't think of. The CSB 750 A that I own
has a suggested magnetic base that I purchased because I had only
an NMO base used with my Diamond Super Gainer 7500 which also
kicks butt. But atop my Tahoe in the far right corner the darn thing
has got to be 10 feet or more in the air at the tip. Lucky the Tahoe
has a luggage rack just for looks basically and I took a long wire tie
and anchored the antenna at the coil to the cross brace of the luggage
rack. It was just too damned easy to knock the entire thing off the roof
considering all the low hanging tree branches we have around here.
and on the left side I made a loop of another nylon wire tie to slip the
antenna tip under when it's folded over. That way the antenna rod is
horizontal and doesn't move. It also doesn't touch the rack brace so
I can still listen with the antenna folded. And I can transmit for just
a short time if someone is calling me, long enough to tell them to stand by.
In that position SWR is about 3:1 and the radio will shut down in a short time
if you keep talking. I keep it folded most of the time because it still
received decent horizontal and I don't have to get out and fold it down
when putting it in the garage or going thru a drive thru. That's the only
disadvantage because at that height it really performs well.

If your wanting a dual band wide antenna for Public Service Band, look at the Comet
CA-2X4SR. I have a roof mounted NMO mount version but they also have a PL-259 version. This
antenna works great on both amateur radio and Public Service Bands and I love it! It is 40
inch tall, so it's right at your limit. I will say that this antenna has very nice gain on
both VHF and HF and it pulls in and throws nice signal. I couldn't be happier. It also has
the fold over feature Milt mentioned. The only downfall I will say is if your going to use
this antenna on a magnet mount, you better find a heave base, as this antenna is
very rigid, so a good base is advised.

Some confusion here..... "The way I see it, correct me if I'm wrong.. a regular power cable (hard wire to battery), the radio loses power when the igniton is shut off."
If the radio is hard wired to the battery, the ignition does NOT shut off the power.

Some people evidently do not wire the main power of the
radio to the battery which is a connection that you can't
turn on and off. This is where the accessory power cord
will turn the radio on and off for you if its source is switched
on and off by the ignition key. Wire the radio direct to the battery.
Use the accessory power cable on a source switched on and off with the
ignition. The radio will turn on and off with the ignition.

Thank you for all your input. For the last few days I have been doing a lot of research with the help of the input several of you gave me.

I like the comet 2x4 but come to find out its too rigid and I don't have the height that i thought seeing as I am going to make this a roof mount magnetic mount and park the vehicle in a garage daily.

Also many of the antennas are either ham only and don't cover the upper vhf ranges which I use sometimes when talking on federal vhf channels (170-172mhz).

So I chose the inexpensive tram 1181 and might still goto the 1182 like was suggested. We shall see.....decisions decisions....

Thanks again,

Jason

I have used both Chirp dailies and Anytone's software. It is really annoying that Anytone's software doesn't allow moving things around easily. Chirp doesn't support all of the extra settings yet (i.e. the macro buttons on the mic). So neither piece of software is there yet, in my opinion. Hopefully the extra settings will appear in Chirp soon. Until a few versions ago, there wasn't even a settings tab for the AT-5888UV.

I think Chirp has supported the radio for 6 months?
If I'm making a major overhaul I probably would use Chirp.
But then I'd have to go into QPS and enable tone decode
for each channel. The left it out of Chirp, we discussed it
for a couple days but they want you to files a bug report
in this case it would be a feature add. I said to a couple of the
programmers go ahead and add the feature, I'm not jumping
though hoops just to make it documented. You know what's
missing go ahead and add it. Well it's not been added yet, if
you write a channel with chirp that should have tone encode
it will set the channel to the right tone but won't take the extra
step to turn the tone on. You have to use the More function
in QPS and go down to the tone section on the list. I only have
two public service channels that use analog tone. I don't care to hear
the repeater ID in morse every 15 minutes, it's twice as loud as the
voice content. But it's not transmitted with tone. However there
is a quirk in some of these radios like the one I use for base, that will
open squelch even if the tone is set and turned on. It has to be the
sub side of the radio, left or right. There, tone decode is useless. Now
switch that side to Main and tone decode works.

In what way, just uploading to the radio? You said you set everything up and then transfer it to Chirp to upload. How do you import the data
into Chirp? And in QPS5888 to upload your file to the radio it takes two steps, select Program from the menu bar and then Write to radio. I use Chirp too. But I'd be more apt to create my channel structure in Chirp then export it to QPS5888 and upload. I value your opinion so what about the QPS5888 software do you find unfriendly? Can't be much when you use it to crate your channels structure and settings.

I found the program quirky for a lack of a better word. I tries to use it when I first got the radio and experiences some software problems. I have since resolved those problems, I also have a portable radio that I use the same channels. I find it easier to program both radios from chirp, QPS allows you to use all the functions where chirp doesn't have all the functions.

I see so besides QPS having some quirks you want to share
your Anytone channels with a non-Anytone radio. I do the same thing
here. Share QPS data with Chirp for a Wouxun, Baofeng, and Yaseu
hand helds and FT8900 4 band mobile. I set up in QPS5888, read the radio
into Chirp, save the img file and directly import that file into the other radios.
Of course there will be some columns that aren't shared in between radios
but that stuff can be quickly edited. Only problem with Chirp and the Anytone radio
is show Chirp handled tone squelch. I've not found a way to turn it on for the channel.
I set it how I was told to set it to decode tone but if you upload the radio into QPS5888
and go to the More column, the tone decode is clearly not turned on. And when using the
AT5888UV for public safety you are going to want full CTCSS usually.

2840. Crossband TX Off

Yahoo group: Anytone_AT-588UV
Date: 2014-03-16 01:30:59 UTC
From: <n8jmr@...>
Topic: 2840 Message: 2840

I'm currently setting up the crossband repeater on my AT-5888UV. I have the right channel set up on 446.4600MHz with CTCSS of 179.9 and TX off is check-marked. The left channel is tuned to a local repeater. I have my HT programmed to TX on 446.4600MHz with CTCSS 179.9, but RX on the local repeater. I turn on the crossband repeat function and it all works, except the AT-5888UV is still repeating the local repeater on 446.4600MHz. To my understanding, it should not do this since I have TX turned off. Is there something I'm missing?

Thanks!

Nope, it seems to be another quirk. I have a couple public safety VHF channels that TX is off. But the Anytone will transmit on them in cross band mode. I basically have the UHF set up the same, 446.900 link to the HT, VHF points at a repeater. Works great and I RX off the Anytone instead of the repeater since it's spotty inside the house on the HT. But if I switch channels to either of the public safety channels while in cross band, it will transmit even though TX OFF is ticked in the setup.

There is no documentation but I'd make an educated guess that the tip is positive.
My strategy to figure out the polarity and trigger voltage would be to use my 1 amp
0 - 15 volt supply and hook everything up with the tip positive. If I see milliamps
rising early I'd reverse the polarity and observe. Then increase voltage until the radio
switched on. That would be a pretty safe procedure thinking that the shield of the plug
is probably at radio ground. So if you have the polarity wrong the milliamps are going to
rise
immediately when you go from 0 volts up.

Contact the person who sold you the radio. That's your only recourse.
Maybe they can just swap it out? Anytone treats their radios
like they should be locked away in Fort Knox. No domestic service, no service literature.

2847. Strange clicking sound when using the separation extension cable...

Yahoo group: Anytone_AT-588UV
Date: 2014-03-21 20:07:29 UTC
From: <cocopugg@...>
Topic: 2847 Message: 2847

I have been using my AT-5888UV as a base station, so outside of the "volume not going all the way down" issue, I really haven't found any major problems with the radio. Today, however, I decided to try and program the unit from my computer, across the room from where I have the radio situated, by connecting the extension cable, and bringing the head to where my computer is. While this allowed me to program the frequencies into the radio, just fine, I noticed that when hearing the radio from across the room, whenever a signal came in, and the squelch level would fluctuate on the Anytone's level meter, a strange "clicking" sound was heard on the radio with each tick up or down on the radio's audio meter. As I scanned my other frequencies, I also noticed that clicking sound while scanning, and when turning the volume up or down. Has anyone else had similar problems while using their Anytone's extension cable? The annoying part is the fact that when the head is connected to the radio, using the small ribbon cable, there is no clicking sound at all. Is this issue a known problem with the Anytone's extension cable, or do you think I have a defective extension cable? I wonder if this is a known issue, and since the Anytone's internal ribbon cable works perfectly, whether we would be able to buy a long ribbon cable (like the internal one that connects to the head to the radio, to use instead of the extension cable they sell (item CP 52)? Could bad insulation from that cable be causing this interference? Thanks!

From: Milton Hywatt
Topic: 2847 Message: 2849

I suppose the cable could be defective. The clicking comes from the fact that everything is transmitted
through the cable. All the knob turns are encoded in serial data to be decoded in the radio and turned into
volume, channel change etc... You can try just a regular CAT5 Ethernet cable and see if that gets rid of the problem.

Subject: [Anytone_AT-588UV] Strange clicking sound when using the separation extension cable...

I have been using my AT-5888UV as a base station, so outside of the "volume not going all the way down" issue, I really haven't found any major problems with the radio. Today, however, I decided to try and program the unit from my computer, across the room from where I have the radio situated, by connecting the extension cable, and bringing the head to where my computer is. While this allowed me to program the frequencies into the radio, just fine, I noticed that when hearing the radio from across the room, whenever a signal came in, and the squelch level would fluctuate on the Anytone's level meter, a strange "clicking" sound was heard on the radio with each tick up or down on the radio's audio meter. As I scanned my other frequencies, I also noticed that clicking sound while scanning, and when turning the volume up or down. Has anyone else had similar problems while using their Anytone's extension cable? The annoying part is the fact that when the head
is connected to the radio, using the small ribbon cable, there is no clicking sound at all. Is this issue a known problem with the Anytone's extension cable, or do you think I have a defective extension cable? I wonder if this is a known issue, and since the Anytone's internal ribbon cable works perfectly, whether we would be able to buy a long ribbon cable (like the internal one that connects to the head to the radio, to use instead of the extension cable they sell (item CP 52)? Could bad insulation from that cable be causing this interference? Thanks!

I wouldn't say all. And some the serial data noise is louder. My newer radio is pretty quiet. Has some
clicks when side B is scanning, side A is receiving a VHF public safety band and the scanning of UHF
channels on side B occurs. I've not heard the serial encoder click with my separation cable either
so maybe Carlos has a bad cable. He can swap it with an Ethernet cable to see.

Welcome to your new toy. What you are describing is data from the head talking to the main unit. Every time you change a channel or adjust volume you get that clicking sound. Unfortunately we all have the same issue.

The interesting thing, is I can't hear it at all, when the head is connected to the radio (using the small internal ribbon cable). So is this interference introduced by the long cable run of the extension cable? Or is the fact that the internal cable is a ribbon cable, the reason why there's no noise when the head is mounted to the radio?

I don't think the radio is picking up any serial data interference from the radio itself. Try a CAT5
jumper if you have one.

From: <cocopugg@...>
Topic: 2854 Message: 2854

I know, the answer is "If it was in the firmware, it can't be fixed"...But isn't there anything that can be done? Can't any of the software companies out there (RT Systems, CHIRP, QPS588UV, etc., etc.) address and fix this issue somehow? I'm so happy with my 5888UV, that if only the loud beep (and of course the annoying abrupt cutoff on low audio) issue could be fixed, I'd say it's the best dual-bander for the money, out there (yes I know Kenwood/Icom/Yaesu/Alinco may be considered better, but is a radio REALLY better, where you have to pay a few hundred dollars more in order to get less: No 220mhz receive, no air band receive, no extended frequency range, both on receive and transmit, on VHF and UHF, less channels, less power settings, etc., etc.?)!

Sincerely,

Carlos

I wish I could say yes there is a way as I would love to get rid of it myself.
Only thing you could do is to make a switch and put it in line if you use an external speaker. Switch the speaker off before you turn the radio on or off. I know the abrupt volume changes is a firmware issue and that needs to be addressed by the person who sold you the radio if they have the correct cable to flash the radio. I don't think there will ever be a fix for the beep since we do not have access to the firmware, nor does anyone
who programs software unless they bought the flash cable and can dissemble the firmware code and then remove the beep. You of course would then need the flash cable to apply the change.

Any firmware updates need to be applied to the radio with a special cable.
And it's applied to both the remote mountable radio head, and the body of the radio.
I have no idea what this cable looks like or where inside the radio and radio head you clip to or plug into but I have seen cables for Hytera and Kenwood commercial radios and handy talkies. Some of the Anytone dealers here in the states bought the cable and you could send the radio back for the flash upgrade if you bought the radio from them.
But if that's not your case you are stuck with what you have unless you want to ship it back to China.

Thanks for your reply, Milton. Since I bought the radio used last year (1 week old, while saving $50 on the price) from another HAM on QTH, I guess I'm out of luck, since I don't have the warranty for it. That being said, would you know if the Anytone dealers who do have the firmware cable here in the states, would offer the firmware upgrade service to anyone who doesn't have their Anytone under warranty? Also, would you know of anyone who has actually sent their radio back, to fix the volume problem, who has gotten the same radio returned, with the upgraded firmware having fixed the problem? Thanks again for all the info!

I know several who sent their radios back to the retailer they bought it from for both a firmware update and some of the early radios also had a bad microhone AGC board located in the radio head unit that was replaced at no cost except shipping. I know of none that have been sent back to mainland China. If you could get a list of Anytone dealers you might send them some correspondence about flashing a firmware update but I know of none currently doing it for out of warranty radios. However I don't know of that many dealers either so you might benefit by doing a little data mining yourself.

The firmware can be reverse engineered. It's pretty simple, not like a Windows 7 operating system.
And groups of hackers / software engineers decompile and recompile firmware code for smart phones
every day of the week. So for this kind of hack if you know what you are doing it's fairly simple. The
only hard parts once the firmware recoding is done is the equipment needed by the radio owner to
reflash the firmwares. This is usually a USB cord with a specific way of attaching it to the inside of the
radio and remote mountable control head. And software to back up your current firmware and upload
new.

There has to be a need to do it. And a want by those who hack firmware to do it.
And yes you are right the phone firmware is much much more complicated to
decompile back to source and recompile. The radio's firmware is pretty simple.
It doesn't really do much compared to a phone. And it can be decompiled back to
source where it can be studied. I guess it's a bit hard to grasp the relative ease at
which this can be done with our without source if you aren't familiar with the process.
I've actually hacked one kind of Windows software, a simple program that reads NNTP
news and added an item into the egg space usually left at the end of the code to allow
a person to spoof their IP address. Now I had instructions and the software, a kernel mode
debugger to make these changes without the need to recompile so it was fairly easy
if you could follow instructions. And I've done some windows apps using Delphi, simple
projects just to learn how out of curiosity. So I'm a bit familiar with the processes. I
imagine
the flash code for the AT5888UV is built upon known code if i know anything about that
stuff
being shared among different Chinese manufacturers. So it may not be as guarded as one
might think. And I also think someone has built a counterfeit AT5888UV and were sued
for it. And Anytone warned any potential sellers not to sell and anyone not to do repairs.
So there may be source floating around for the firmware. Personally I really don't care.
Without the proper cable which is available, I have no need to hack the radio. But there
are plenty or resourceful people who make this kind of stuff a hobby, again depending
on popularity.

Milt.

Here's one I just came up with. Let's say I was to connect a cloning cable from my Anytone to one of those Anytones that were sent back and flashed with the new firmware, which was fixed of the "low audio not fading completely out" problem, and I was to clone the other radio to mine...Would that fix the audio problem on my radio? Or would the other radio and mine be incompatible to be cloned (since both would then have different firmwares)?

You wouldn't be cloning the firmware, Just the radio's programmable NVRAM.
I believe the radio's operating software is written from NVRAM to a flash type
RAM upon boot. This allows the user to make temporary modifications that aren't
written to NVRAM.

Subject: [Anytone_AT-588UV] Re: Nice radio but the volume control is problematic

Here's one I just came up with. Let's say I was to connect a cloning cable from my Anytone to one of those Anytones that were sent back and flashed with the new firmware, which was fixed of the "low audio not fading completely out" problem, and I was to clone the other radio to mine...Would that fix the audio problem on my radio? Or would the other radio and mine be incompatible to be cloned (since both would then have different firmwares)?

I purchased my radio in October 2013 and it doesn't have a "Boop" on start up, also the volume does go all the way off. The only problem I have is I can't get the dual watch to work, I don't see a setting in the program for the option and when I push the H/M for half a second it goes into VFO mode. I think they have fixed some things and some others have been made worse.

When I press and hold the HM button the radio will go to VFO and then back to the channel it was on.
It will do this back and forth regardless if there is a signal on the VFO. I had 162.400 on the left VFO
the weather and it's continuous. I don't know if it will stop and stay if the channel becomes active but
I imagine that's the purpose. Oddly though when operating the dual watch on the right side it set the VFO
on the left side to the frequency the left side channel was set to. Previously set as I said to the weather
frequency. I don't think that's the way it's supposed to work, operating dual watch on the right side shouldn't
change anything on the left. When I operate it on the left it doesn't affect the right. I don't use this feature anyway so
it's no big deal for me. And also I find that your radio doesn't make two beeps when you turn it on odd.
I own two radios. One an early build with the serial ending in 00036. I forget the date I received it but
it had to be over a month after I started this group in Sept. The newer radio has no lettering or numbering
on the top of the faceplate and its serial number ends in 00283. I'm thinking the last three or four digits indicate
what number in line the radio was completed and boxed up.

You know this might not do anything at all but if you have
your radio's current configuration backed up on your PC
you might try to reset the radio. I think you hold the right SCN
button and power up the radio. Don't get your hopes up though
it was just a thought.

2872. Beep volume

Yahoo group: Anytone_AT-588UV
Date: 2014-03-26 18:59:36 UTC
From: Milton Hywatt
Topic: 2872 Message: 2872

Menu set item #53 controls the on and off double beep somewhat.

It does make a definite difference when set to low. Pres Set, rotate main band encoder to item #53. Press the encoder momentarily.

Make sure the setting is Low by rotating the main encoder. Press and hold the Main encoder to save the setting. Too bad they didn't include an Off setting. But if your radio is set to High this may lower it enough to make it tolerable.

Yeah it is just a slight difference but like I said it may just take the edge off enough to make it more tolerable. Also there is a set menu item #5 Beep Function, On or Off. That when set to on adds a beep to when you push buttons. And it may very well be with the latest firmware you can turn the startup beep off. However the poster today who said his October purchased radio doesn't beep doesn't have a new enough radio to have the newest firmware unless he sent it back to the retailer to be flashed.

I don't personally know of anyone but I run across people in my daily reading who do like to make some of these Chinese hand held radios do new tricks. Thing is they need the radio to do anything. So I don't really anticipate anyone doing anything with the AT5888UV. But I will keep an eye open and do an occasional bit of data mining to see if something new pops up. Until then enjoy as much as possible what you have.

2881. Is there an in-line volume control that can be added to lower the volume all the way down?

Yahoo group: Anytone_AT-588UV
Date: 2014-03-27 16:50:25 UTC
From: <cocopugg@...>
Topic: 2881 Message: 2881

Since my AT-5888UV suffers from the "volume does not turn down all the way" problem, is there an in-line volume control that can be added between the radio's audio input and my external speaker's 3.5mm plug which would allow the receive audio on my radio, to be brought all the way down? Or would any such device simply allow for raising the volume, but when lowered, it would also cut off, rather than fade out completely?

Thanks again!

Nothing I know of Carlos. I wouldn't even know of an insertion point. This is because a microprocessor inside the radio body is responsible for the volume. The volume controls are merely active encoders that send position data via a serial data link from the remote mount head to the radio body. I'm sure the radio is soft pot tweaked at the factory in batches
by firmware. Is it field tweakable? I don't know. My Yaesu FT8900 uses this serial data model
and the radio does have a service mode you can put it in to various alignment procedures by using just the radio's LCD screen. The AT5888UV probably is similar but no service literature
exists that I know of. For the FT8900 you can download the entire extended manual that includes
service data. WHy the Chinese have to be such paranoid jerks I don't know. They've denied my requests for service errata saying it my fall into the wrong hands. What a load of BS.

Too bad the radio doesn't have a plain mute function for each side. It does a great job muting
when you have it set to mute the sub band when the main band is active. My FT8900 has the same mute but it doesn't work. It only slightly drops the sub band volume, doesn't mute at all.

Thanks for the reply, Milton. I didn't think it would be an easy fix. It still all goes back to the firmware I suppose. You're right about the Chinese manufacturer though. Why would the Yaesu FT8900 have service literature, but the Anytone doesn't? My guess? The Chinese want these radios to be "throw aways", not to be serviced, but rather to be thrown away by the end user, so they will buy a newer replacement model (also to be a "throw away") when the customer isn't satisfied through the radio's flaws, and lack of customer support. While the price point on the Anytone (and other such Chinese knockoffs of the Yaesu) may be a little lower than the Yaesu, is it really worth it longterm, when customer support isn't there for the radio?

When I made my purchases I fully expected domestic in and out of warranty
support besides sending the radio to China or back to the dealer. If you send
it back to China you'll have a hefty round trip shipping fee, mabye around
$150. I doubt Anytone would pay to send it back to you in or out of warranty.
I know darn well these dealers are sitting on a lot of returns from unhappy
customers. Some more unlucky dealers who got stuck with a high proportion
of less than satisfactory operating radios will certainly not deal with the company
again. I know of one dealer who was very unhappy with Anytone and Wouxun
that dropped the Wouxun altogether. Why he chose to add an Anytone dual band
walkie talkie to his venue I'll never understand. I'm happy enough with these two
AT5888UV's. Especially the deal I got which was basically dealer cost + shipping.
I won't feel too bad when I have to toss them in the junk bin. It saddens me a bit,
I had high hopes for this radio after owning a Wouxun UV6D dual band HT. I thought
and still think it has great performance even if it is not true UU / VV dual RX, I hardly
want to use it for a cross band repeater or listen to two channels simultaneously active.
So the dual watch is fine for me. I actually own two of those and a whole bunch of
batteries
8 in total and two alkaline packs plus a speaker microphone. But now I'm hearing those
radios some of which have a limited number of on and off cycles. During the bootstrap
memory is dumped into a flash ram so it can be modified, safely separate from the radio's
operating software. Well some of these chips stop working prematurely when they are
designed
to have 100,000 or more write cycles. The radio will still work but you won't be able to
store
channels. I also have a Baofeng UV5R American version called the F-11. Good little cheapie.
Works better with the speaker mic, the internal speaker a little tinny. Otherwise mo
complaints
except a strong birdie on 442.000 mhz you can't get rid of even if you shift the CPU clock.
Doesn't bother me, no repeaters around on that frequency except one up 600khz on 442.600
where the birdie is gone. Oh well, I guess try to enjoy what you have. My FT8900 is stowed
away. No 6 meter repeaters on FM close enough to use and I have 10 meters on the HF all
mode
rig.

So how many amps does the supply deliver? You said 50w which to me means 50 watts. Power supplies aren't usually rated in watts they are rated in amps. If the supply can give 20 amps continuous then you will need to check that it is still delivering 13.8 volts as the radio shuts off. If it does keep delivering voltage, then replace the fuses in the radio's power cord. There are two 20 amp on the extension and one 15 amp on the radio cord. I've had problems with these fuses in one of my radios where the radio would shut off. And that fuse whisker does heat up during transmit. It could be not soldered properly. So substitute the fuses if you know for certain the supply voltage is stable. These fuses can appear to be ok to the naked eye but open when current passes through them, then reestablish a connection when they cool.

the power supply you need has to be at least 10 amps to run a 50 watt radio. Your cheap Pyramid and other brands that have a IC chip regulator in them will not let you set a VHF/UHF rig close to them and talk on it as the RF gets into the chip and will do 1 of 2 things shut down the power supply or make it run full power and if it opens up you will get spikes of as much as 18 volts going to your rig and this is not good. So spend a little on a good supply..

jet stream makes pretty decent power supplies and you can get a 28 amp surge, 25 amp continuous supply for around 85 bucks.
like this one:
http://www.randl.com/shop/catalog/product_info.php?cPath=13_9110&products_id=38518

I have no affiliation with the seller.
I know of several of these in daily operation in high RF environments and they're not noisy and they're very stable.
Great for HF, VHF and UHF radios up to about 100W of RF output.

Based on your description, if the PS says 50W, the calculations say it puts out about 3 amps.
this radio needs at least a 10 amp supply to run on high power.

Subject: [Anytone_AT-588UV] Power supply for the transceiver!

Hello ALL I am trying to set this radio up as A base in my ground floor apartment need to know the best power supply that I can use that wont interfere with neighbors electronics I currently have a Pyramid 115v, ac60hz,with 50w and output of 13.8 dc regulated power supply brand new.I try and talk on the radio even on low power and it shut off after about 20-30 seconds but the power supply stays on could someone help with this problem?Thanks,Don.

The Anytone automatically shuts down when the supply voltage drops below about 12V- I don't remember the exact cutoff voltage. I suspect your power supply will not handle the current required by the transmitter, and the voltage drops and the radio powers OFF.
Here is an inexpensive 30A supply that I use with no problems:
http://www.ebay.com/itm/12V-DC-30A-360W-Regulated-Switching-Power-Supply-/261198916470?pt=US_Lighting_Parts_and_Accessories&hash=item3cd0ab2b76 http://www.ebay.com/itm/12V-DC-30A-360W-Regulated-Switching-Power-Supply-/261198916470?pt=US_Lighting_Parts_and_Accessories&hash=item3cd0ab2b76

According to my Diamond GZV4000 the radio shuts down close to 9 volts.
However that's just idling in RX. And is over the 12 volts + - 15% voltage
requirements. And that Diamond has been a
superb switching supply 40 amps continuous 5 - 15 volts variable out,
combination amp and volt meter and built in speaker and front access to 10 amp
cigarette plug and 6 amp push in connector. Variable speed fan makes it quiet.
But it's $179.00 too. Not cheap. Mine hardly ever gets shut off. And it's 11 years
old. Take the top off once a year and blow the dust out is about the only time
I ever shut it off.

I agree about astron.
For anyone who cares, the easiest way to get an approximate idea of what current a power supply is capable of if you only have the wattage labeled is take the number in watts, IE 50W and divide by the rated voltage, IE 13.8, or basic Ohms Law.
50W/13.8V = 3.62 amps or so.
Add some heat and inefficiency and you get 3 amps.
Now, this does not apply to calculating how much current a radio will draw given a specific RF output.
One reason being that RF transistors and all the other associated components in a transmitter are rather inefficient.
So, a good rule of thumb, is to tripple the number you get from a basic ohms law calculation like the one above.
Let's say your radio transmitter puts out 50W of output, and you are running it on a 13.8V supply. The number we got already is 3.62 or so amps. Tripple this and you get 10.86 amps required to keep that radio transmitting at 50 watts of rf output. Approximate of course, and some newer radios are more efficient only requiring 8.5 amps for 50W of output.

It used to be a requirement to understand and be able to make calculations with Ohms Law for the basic or entry level amateur radio license exams in both Canada and the US...perhaps not so much anymore.

Subject: [Anytone_AT-588UV] Re: Power supply for the transceiver!

I looked at the site selling Pyramid supplies and the 50 watt supply is not nearly large enough to handle the Anytone Radio. I also believe that the pyramid supplies may have a thermal breaker which trips on over load and than resets itself.

The Pyramid PSK8kx Supply is rated at 6 amps and is also rated at 100 watts would not be large enough to supply the necessary current for the radio. I would suggest that you invest in a power supply by a reputable company with real specifications.

I am providing info that I used to find out abt the Pyramid Power Supplies.

http://www.ebay.com/gds/Top-5-Pyramid-CB-Radio-Power-Supplies-/10000000178241019/g.html

I personally have good luck with the Astron brand of power supplies. I have used these i n commercial service for 30 years with little to no problems.

2900. digital noise coupled into audio and scan rate

Yahoo group: Anytone_AT-588UV
Date: 2014-03-31 00:55:37 UTC
From: <egroups@...>
Topic: 2900 Message: 2900

I installed my 5888 in my vehicle this weekend and found using the supplied extension cable, I get noise coupled into the audio any time there is an update of the LCD screen like a change in signal or frequency. i.e. the serial data is being coupled into the audio. Anyone else have this problem? And more importantly, anyone have a solution? I was going to try some individually shielded pair cable...

Also, am I just spoiled with my FT-857 or is the scan rate painfully slow on the Anytone? I'm getting maybe 2 stations a second.

2901. Re: [Anytone_AT-588UV] digital noise coupled into audio and scan rate

Try a CAT5e jumper. I know of one other person who had serial data noise using the extension cable but never heard back if he found a solution. And yes the scan rate is slower than the Yaesu. But the Yaesu scan rate is pitifully slow compared to my GRE scanner that scans a couple hundred per second.

So you've had problems with serial data noise and it was remedied with shielded cable?

Category 6 cable? I'm not sure if shielded CAT5e would be cheaper but it's bandwidth is more than enough at 100 MHZ considering the baud rate for the bidirectional serial data is around 19.2 KHZ. Don't know for sure, Anytone won't give out service literature. But if you go by other remote mountable radios that Yaesu makes I'm pretty sure they use that frequency. What I'm really after is to decouple any cross talk from the serial data RX and TX lines so you would probably need to know what pins those are on in the radio's connectors and make sure they are one of the twisted pairs. I don't think there is noise getting out of the radio so shielding probably isn't the answer.

So how about it, have you tested this out with unshielded CAT5e against shielded CAT6a ? Or is this just an opinion.

I really cannot be sure since I have no way to recreate the noise. I do know that

if I install a 25 foot plain old CAT5 jumper the radio is quiet. But that really isn't much to say because the supplied separation cable made no noise either. I'd say if the separation cable makes the radio noisy that it is probably the cable. Check with your ham buddies and see if someone can lend you a 12 foot CAT5 jumper. Certainly someone has a home network and wideband internet.

If it doesn't say Yaesu, Kenwood or Icom on it QST always goes pretty harsh. I don't pay any attention to the comments of one or two people. They gave absolutely no consideration to the radio being a prototype. Now if they review a new radio from say Icom, they are using a production model. Not fair tactics. My base radio is on all during the day into the night before I go to bed. And it will get switched to cross band mode if some severe storms develop this afternoon and tonight and tomorrow so I can use a Skywarn repeater I can't hit reliably with my HT. I don't like to be tethered to the base in the shack when there are warnings issued by the NWS. And the radio really shines as a cross band repeater.

I'll never understand the harsh reviews given to "commercial band" radios, simply because the ham bands are only "part" of what the radio covers. Why doesn't anyone in these reviews ever mention the fact that while most of the major amateur radio companies only cover the HAM dual band frequencies, the Anytone (and other Chinese commercial band radios) also cover the same bands, plus police, fire, ambulance, taxis, weather, etc., etc., making them not only a ham radio, but also a scanner as well. Don't get me wrong, I know all about the intermod issues, and how that particular problem is less existent on radios that are dedicated only for the ham bands, but essentially, when you consider the fact that the compromise of covering more frequencies through a commercial band radio, weakens the radio's performance on the ham bands only slightly, and is only noticeable to "nitpickers", don't the Anytone, and other "commercial band" Chinese radios offer the end user more bang for the buck, than what the big boys offer?

Actually these Chinese radios are commercial radios
that also cover the ham bands, not the other way around.
People tend to forget that and wonder why they don't have
all the bells and whistles ham radios have. And being designed
to cover commercial bands they sometimes run into issues in
they way they perform in the ham bands. Also, most every ham
radio covering VHF/UHF I've owned, and there have been over a dozen,
were easily expanded to transmit in commercial bandwidth. And all
of the radio made since the early 2000's already received commercial
bands. Some like my VX5 Yaesu being able to receive short wave all the
way up to 999.999 MHZ in narrow, wide and broadcast wide FM. And AM.
Only thing it didn't receive was SSB.

Subject: Re: [Anytone_AT-588UV] Re: Harsh qst review.

I'll never understand the harsh reviews given to "commercial band" radios, simply because
the ham bands are only "part" of what the radio covers. Why doesn't anyone in these reviews
ever mention the fact that while most of the major amateur radio companies only cover the
HAM dual band frequencies, the Anytone (and other Chinese commercial band radios) also
cover the same bands, plus police, fire, ambulance, taxis, weather, etc., etc., making them
not only a ham radio, but also a scanner as well. Don't get me wrong, I know all about the
intermod issues, and how that particular problem is less existent on radios that are
dedicated only for the ham bands, but essentially, when you consider the fact that the
compromise of covering more frequencies through a commercial band radio, weakens the
radio's performance on the ham bands only slightly, and is only noticeable to "nitpickers",
don't the Anytone, and other "commercial band" Chinese radios offer the end
user more bang for the buck, than what the big boys offer?

It would shine brighter if you could properly disable the Tx from the repeater side so it's not always trying to retransmit back. I have yet to find out how to make that work.

That issue is probably an antenna or feedline problem making the radio talk to itself. I can run full power on both sides and only get a little de-sense. I use 75 feet of Belden 9913 coax and a Cushcraft AR 270 B dual band antenna 30 feet from the ground. I've got almost a flat match in the center of both bands using an MFJ antenna analyzer.

I'm talking about a crossband repeat scenario where I'm trying to stop it from transmitting back to my 440 side that my HT is connected to. Im trying to setup my dual band HT to receive on the 2m side but transmit on my 440 Xband fq, which in turn relays through the 5888uv and sends it on to the 2m repeater. My problem is that when someone keys up from the repeater side, the 5888uv tries to send that received signal across the xband repeat to my 440 and in turn back to my HT. I can see on my power meter that the rig is trying to send the signal back from the 2m side to the 440 and its still trying to transmit back to my HT...which it shouldn't be doing for legal reasons. There's no way to ID across that direction.

That's the way it's supposed to work. And you can't disable transmit.
You can only turn off PTT. I've never owned a dual band that you could
disable the TX on one side. Nor one that you could program an ID for
one side. I won't get into the legalities of not being able to ID on 440
it's been discussed to death. All I can say is in the decade I've been using
it I've never received any complaints. Only thing I can think of that might
work for you is a dual band duplexer. Run the radio out into the duplexer.
Place your antenna on the 144 mhz output and a dummy load on the 440 output.
That might filter 440 from going out the antenna.

so you want lock band repeat, or repeat in only one direction.
and what is this about legal? you are identifying with your callsign through the cross band repeater and that is what is required by law as the control operator...there is no need for an automated ID to be sent.
The repeater that you are cross banding into, and out is identifying, as are the operators using that repeater, so all is quite legal with regard to running a full cross band repeater on the ham bands.
cross band repeat works as you say, where the received signals are transmitted on to the other band from both directions.

Problem if you are worried about the legal aspect is
when you ID using your HT, it's not the repeater transmitter
Id'ng. And who using the two meter is going to ID your xband
repeater even if that was enough to meat the FCC's rule.
The only thing you could do at regular intervals would be
to exit cross band, switch sides to UHF and do an ID by voice.
Or play a morse code recording. Then return to cross band
operation, wait for the next required interval, and repeat.

I'm sure the radios exist. But just none I owned that I can remember
had the feature. Like I said earlier I won't lose any sleep operating
cross band without a mobile or portable link ID. I think my idea of
adding a duplexer and dummy load for the 440 side might work.
I'm just wondering without actually having looked it up what the attenuation
would be. If it was like -150 dBm it would probably remove all the
440 from the 144 output but I seriously doubt it. You might need a pair
of tuned cavities for that kind of performance but since I've not played with it
I could be 100% wrong and it could work well seeing the distance between the
two frequencies. I could probably build a passband filter that would keep
all 440 out of the antenna connection. Add operating the Anytone on the lowest
power setting on 440 and you wouldn't need a duplexer or dummy load.
You just need to be creative, have some tools and a computer to do a little
data mining on building some RF filters that will handle a few watts.

ok, eyes up guys, here's a really super simple way of defeating one side of your cross band repeater:
In this senario, operator wishes the 5888 to retransmit his 440 signal, from the handheld, out to his local 2M repeater, and receive, same repeater, on the handheld without the repeater being retransmitted back via 440 on the mobile radio.
very simple, set up the mobile radio with the 440 frequency of choice, including tones to prevent other users on that frequency from unknowingly accessing the repeater. Set up the other side with only the 2M repeater input frequency with whatever tone you may need to access the repeater on tx. However, instead of using the same tone for RX on the 2m side, simply change the rx ctcss tone to something other than what the repeater is putting out, and the radio won't even hear the 2M repeater coming back and will not transmit anything it can't hear.
So yes, you may have to program a new pair of frequencies for 2M repeater input including tx tone, and different tone then the what the repeater puts out for rx, and a new 70CM frequency with an uncommon tone for your hand held to talk to the radio.
Try it, in my mind it should work in the way you want where the radio only transmits to the 2M side from your 440 side but since the ctcss tone is different on the 2m receive side of the radio, it won't hear the repeater...this is, of course, assuming the repeater uses tone, and if not, it won't matter anyway because the radio needs to hear a tone to open up the receiver when ctcss is enabled.

here is a hypathetical senario:

2m repeater 147.1 +600K ctcss 110.9HZ.
70CM simplex frequency 446.050 ctcss 67HZ

Program 5888UV on 446.050 with r tone of 67hz and t tone of 67hz. Program handheld with 446.050mhz with at least tx tone of 67hz (or whatever)
Program 5888uv on 2m with 147.7mhz with a Tx tone of 110.9, and an rx tone of anything else that isn't 110.9.
Do not program the 2M side like a repeater, but leave rx and tx frequency the same.
If you want to get particularly secure use some dcs codes on the rx side of 2M...and on the 70CM side as well if you want as long as your handheld supports it.

I hope all that is clear enough and makes sence. it will absolutely work...even the other users of the repeater who are transmitting on the same input frequency won't be retransmitted on your 5888uv as long as the rx tone is different than the repeaters rx ctcss tone.

That's a good idea. All you need to do is to put a PL decode
tone on the repeater output so the radio does hear it. Or put a DCS
on the repeater output. And if you want to use that repeater with the
radio in regular mode make another channel with the proper settings.
One problem with a lot of these radios and PL decode is it only works on the Main
designated side. I'm not sure if this applies in cross band mode though it
might. That's simple just make the repeater side Main. And it may not
make a different using DCS what side is main.

actually having looked it up what the attenuation
would be. If it was like
-150 dBm it would probably remove all the
440 from the 144 output but I
seriously doubt it. You might need a pair
of tuned cavities for that kind of
performance but since I've not played with it
I could be 100% wrong and it
could work well seeing the distance between the
two frequencies. I could
probably build a passband filter that would keep
all 440 out of the antenna
connection. Add operating the Anytone on the lowest
power setting on 440 and

you wouldn't need a duplexer or dummy load.
You just need to be creative,
have some tools and a computer to do a little
data mining on building some RF
filters that will handle a few watts.

That's
the way it's supposed to work. And you can't disable transmit.
You can only turn off PTT. I've never owned a dual band that you
could
disable the TX on one side. Nor one that you could program
an ID for
one side. I won't get into the legalities of not being
able to ID on 440
it's been discussed to death. All I can say is
in the decade I've been using
it I've never received any
complaints. Only thing I can think of that might
work for you is
a dual band duplexer. Run the radio out into the duplexer.
Place
your antenna on the 144 mhz output and a dummy load on the 440 output.
That might filter 440 from going out the antenna.

Subject: Re: [Anytone_AT-588UV] Re: Harsh
qst review.

I'm talking about a crossband repeat scenario where I'm trying to stop it
from transmitting back to my 440 side that my HT is connected to. Im trying to
setup my dual band HT to receive on the 2m side but transmit on my 440 Xband fq,
which in turn relays through the 5888uv and sends it on to the 2m repeater.
 My problem is that when someone keys up from the repeater side, the 5888uv
tries to send that received signal across the xband repeat to my 440 and in turn
back to my HT. I can see on my power meter that the rig is trying to
send the signal back from the 2m side to the 440 and its still trying to
transmit back to my HT...which it shouldn't be doing for legal reasons.
 There's no way to ID across that direction.

Well for settings such as doing the extra setting of turning on ctcss or dcs tones on you will need to click on the double arrows for the extra setting. This is on the anytone software. Its just 1 more extra step, but chirp doesn't have most setting the anytone software takes care of.

Yeah, I use the factory software for the settings that Chirp doesn't have.
But Chirp's ease of populating the basic channel list is a better interface
if you are going to be copy and pasting from one template to another.
Also the file Chirp creates when you save your radio's populated template
is directly importable into a totally different brand of radio. Some of the cells
may be incompatible but for the most part it does a good translation and
save a lot of time. I've taken my Anytone .img file and imported it into
chirp and loaded it into a Baofeng and Wouxun HTs. Then closed that file and
downloaded from the Baofeng, dressed up the template where there were
incompatible settings then sent it back to the Baofeng. Result was same list
of channels in the same order on all 5 of my Chinese radios. One thing I found
that is an important missing feature for the Anytone is that Chirp will not turn
on PL tone encode. This is an extra step in the Anytone under the More column.
The people who write the code for the additional radios and features know about it
but want me to formally request it. I told them that is they already know there's
no need to request it. So if you run into a PL tone issue, use the Anytone software
and make sure that under the column with the two >> in it (More) you duble click and
enter the extended feature menu.

So, I have determined it has nothing to do with the cable.
I did try the cat 7 cable (individually shielded pairs) and it made no difference.
If you disconnect the connector at the main body while the radio is on, it stays on. The noise was still present with no cable attached so it has nothing to do with the cable.

I'll have to record the noise because it's really quite apparent. Maybe I just got a bad radio.

Obviously a longer cable does change 'something' in the radio body. I know what the noise sounds like because I can hear it slightly from the radio's speaker in my older radio. Adding a communication's speaker that has a high shelf cut off doesn't reproduce the noise since it's higher than the vocal range of normal conversation. the older radio will alsom make a high pitch whine when receiving on the right side of the radio with the volume off. The external speaker takes that out too. We've been discussing ways to bandpass this noise from the audio the first day the radios started getting to the customers. It's anyone's guess where this serial data noise gets injected into the audio stream. It may have something to do with the audio gain controller which is controlled by the radio body's MPU. All inputs on the control head are changed into serial data and sent through the cable. Only 5 volts, ground and the microphone output are analog signals. I've never heard anyone complain this noise being transmitted so it has to be getting in to the audio output signal path somewhere. I don't think we'll ever see any service info, circuit descriptions schematics for these radios. The only thing you can do is compare it to the Yaesu FT8800 which employs the similar operational principals and see how they do it because you can get service data from them.

Actually you are wrong William. Humans with 100% of their
hearing can hear generally well over 11,000 hertz. Now,
if you were to say that the frequency response of a human voice
over narrow band FM is limited to 300 hertz that's a little closer
but not much. I'm sure from the microphone of who you are talking
to, to your speaker, is at least triple if not more. Personally I like
my frequency response to start above 200 hertz so I don't hear any
PL tone. Somehow the AT5888UV manages that on its own. In contrast
my Yaesu FT8900 and either the internal or the external I also use with the
Anytone will allow PL tone to pass through to the speaker.

Human hearing, for an average healthy specimen is actually more like 20HZ to 20KHZ.
Where the idea that we don't hear below 300Hz came from I don't know lol.
In fact, if you actually do the research, you will find that an average male human voice is centered well below 300Hz in the 200's and lower.
If you have a particularly deep voice, it will resonate well down into the 40HZ range as well, though the bulk of the audio energy will be above 100HZ.
Human speech rarely goes above about 800HZ in an adult.
Recorded speech will go much higher simply because of harmonics and vastly increased gain on higher frequencies to give a flatter listening experience.
My personal hearing range is approximately 32hz to 13KHZ...obviously not linear and there are plenty of holes in there, but everyone has those regardless of how good your hearing might be.
Just think about it, if we couldn't hear below 300HZ, then how come we can hear the subs on a car stereo which typically resonate well below 80hz? Examine any audio equalizer and you'll see adjustments for frequencies well below and above 300hz.
Download a free tone generator on your computer and, with a decent set of headphones, or even a crappy set, test your own hearing. You'll find that even on the cheapest, 2 dollar set of headphones, you will hear well below 80HZ, and well above 10Khz.
use good headphones and you'll hear down to 30hz and up to and beyond 15khz.

Regards
Colin

Bill, You are kinda off base with your Human Hearing frequencies, They do not stop at those frequencies. (Maybe your speaker does)

The 17500 cycle Horizontal oscillators in all of the early TV sets was noticeably audible, and often objectionable, to many people, and all the Wurlitzer and Robert Morton Pipe organs had pipes tuned to 12,000 cycles. (C7)

And your low frequency cut offthoughts are also way off. I play base notes at 16 CPS on a local theatre pipe organ for shows each week. If I omit them, the management ask me "whats wrong with the Organ"

To verify, You can get free audiometric hearing test at Sam's stores. Ask them to extend the ranges of test.

Or just use an audio oscillator and a GOOD pair of headphones and test your self. If you are not too old and have not been exposed to loud impact noise in your life, you may be surprised

Note, if you plot it on Log paper (frequency base line (X), and the threshold levels on the Vertical (Y), the graph will tend to be normalized to a straight line as in decibels, but not truly logarithmic. Every 3 DB is about twice the Sound Power.

DIJ

Bet this opens a can of ideas..

Seems like everyone knows what this sounds like, but just in case..

https://www.youtube.com/watch?v=cRYk2OXdLsQ

I noticed that the external speaker output is disabled when the squelch is active (squelching) so even though I can hear the ticking in the mic speaker, it is quiet in the external speaker when there is no incoming signal above the squelch level. As soon as a signal exceeds the squelch level and audio comes through the external speaker, I can here the ticking again.

Here is what my experimenting with this issue the past couple days since this has come up. My current set up was using the provided black extension cable. I also use reasonably priced external communications speaker. The only time I have the ticking sound is when I have both bands on VHF and scan stops on a active channel then I also have that ticking. For some odd reason this disappears when I have the bands on VHF and UHF, or I don't have it at all if I use the provided short cable. So I did some more trial and error and plugged in different cables with different qualities that I had in my computer box and found that a better quality cable does quiet down the ticking. Also using a better quality external communications speaker pretty much makes is unhearable. So what I recommend is a better extension cable and a good quality communications speaker.

Very possible a longer cable changes the impedance between the UARTs in the remote head and the radio body. And some radios because of a lack of quality control in components are sensitive to this change allowing the serial data being sent from the remote to the radio body to jet into the volume. All that is transmitted back to the radio is the LCD digits, any
mode indicators and the signal meter. If you listen to the audio from the speaker mic, you probably will hear a lot of this serial data noise. The only way they can send audio to the mic
is to encode it from the radio and then decode it in the mic itself with digital to analog conversion
and some sort of amplifier inside the mic. The only audio going through the extension is mic
audio for transmit.

Topic: 2900 Message: 2950

On the old radio, #36 off the production line, I have all sorts of oddities as to what band side A and side B are the Main and Sub bands. With side A being on a 155 mhz channel and designated Main and side B being on a 146 mhz channel and obviously the Sub band, the squelch will open while driving around. If I hit the A/B switch reversing the bands the squelch closes. Also when the same channels are used and switched back to Main/Sub if the volume is off on the 146 channel and it becomes active, I will usually get a very high pitched whine until I turn up the volume and then immediately turn it back off.
It does not do this when A/B are reversed. How odd is that? And this is with the 3 inch ribbon cable.
I'd leave it like that but when the 155 mhz channel becomes active and is not the Main band the audio crackles when I'm moving. Switch 155 back to Main and the crackling stops.
So rather than hear the whine and open squelch when ever it decides to open it on the 146 channel on side B, I leave it Main so the squelch only opens on signal, and endure the 155 side crackling. I almost always roll with these two frequencies one being local law and the other
a repeater that I favor. I'd almost give up my left testicle for someone who can explain for
certain these anomalies using a circuitry flow chart. I've not had either radio apart yet but I'd be
willing to bet there aren't a lot of hard pot adjustments inside. My guess is firmware sets up the ball park alignment and the radio has a secret service mode and a list of alignment points to take some readings and inject some tones using a service monitor. The Yaesu FT8900
I own is aligned that way. and it doesn't have to be saved when you exit the service mode. So in that mode the front panel inputs must change the firmware or whatever form of writable
memory the radio uses for these values because you can't reset the radio back to default to change an alignment error. I'd also bet like the Anytone, all the channels and their settings
are stored in the remotely mountable head and not the body of the radio. I have a prototype remote head and it had all the settings and channels the person who I got it from had when I hooked it up to my radio body. It also had no setting for speaker mic and the lights on the
microphone would not illuminate. But the microphone worked otherwise, go figure huh ?

Oh and thanks Todd as always for taking the time to experiment. I think I'm going to pull the radio body from my SUV, it's just slid under the seat anyways, and open the radio up. I'm curious to see what all I can recognize and have a look at the quality of the component installation and solder job. And also interested if they are using some name brand components
for those that actually might have some printing and are big enough to read. And I'd like to see if they use a Mitsubishi wide band RF MOSFET for the final, very popular among the Japanese brands.

My guess is that your inadvertently set up some toning option like 5 tone self ID. Or another 5Tone signaling option that activates when you press PTT.

Sorry about all these tests. Yahoo acknowledges the problems.
I actually got a reply from a human confirming some users had

problems. Hopefully they have it fixed, I'm getting email from
yesterday, mostly my tests LOL but there is a new member request.

If I have more trouble I'll switch the POP server to Gmail if possible.

I have to create a new member to send messages and replies from

Gmail SMTP or find some way in the group settings so the group

process recognizes that email is from me.

Milton

Because you're probably trying to transmit on a frequency where the radio isn't able to transmit on, like the 220mHz band.

You are correct. I just dialed in 220 in VFO and it beeps 5x when you press PTT. And the display says OFF. I had forgotten that behavior. Does the same thing below 136 MHZ for the Air band.

2964. PTT off in VFO side A VHF band

Yahoo group: Anytone_AT-588UV
Date: 2014-04-12 15:03:41 UTC
From: Milton Hywatt
Topic: 2964 Message: 2964

I cant turn the PTT lock off, item #22 in VFO A in the VHF band.

the value for LOCKT is OFF but side A still doesn't transmit. It will transmit in UHF. Now when I change the value of LOCKT to BOTH, neither side will transmit in VFO or channel mode. Changing back to OFF allows transmit on both sides every which way except side A in VHF VFO mode. I guess I'll have to open up the software and see if there is something set in there that I was unaware of. Or the radio lost it's marbles and needs reset and reloaded? I'll advise.

2965. Re: [Anytone_AT-588UV] PTT off in VFO side A VHF band [UPDATE]

Yahoo group: Anytone_AT-588UV

From: Milton Hywatt
Topic: 2964 Message: 2965

Loaded the radio into the software. Checked the Function setup and PTT lock was set to off like it should be. I have it set to ON but in a per channel basis where I don't want an accidental
TX. I loaded the template back to the radio, still no TX on side A VFO in VHF band above 136 MHZ.

Ok next step restore to factory defaults. Hold right SCN and power up. All digits in the LED
light up for maybe 5 seconds then BANG. back to a red color display, factory defaults have been
restored. Switch to side A which was in VHF band and I can now transmit. Reload a saved template
from March, radio is back to its usual channels and settings and VFO side A VHF transmit is now
enabled.

2966. Software / VFO

Yahoo group: Anytone_AT-588UV
Date: 2014-04-12 17:06:23 UTC
From: Milton Hywatt
Topic: 2966 Message: 2966

Ok after correcting the inhibited TX on side A VHF band VFO, I'm looking around and notice many of the radio's 55 function settings that should be available in the QPS5888 software are not. These are only accessible in the set menu on the radio. I don't understand why Automatic Repeater Split ARS ON/OFF is not in the software except in of all places the Hyper Channel edit. Why not in Function Setup? If you just want to use the VFO in simplex you have to turn ARS OFF. If you try to set the repeater mode RPT MOD to OFF while the ARS is on and has selected a - or + split, you cant change it to off. So setting say the simplex call channel in VHF ARS gives it a minus split that you can't change to OFF unless ARS is OFF. And you cannot dial in the SHIFT frequency to say .600 or 5.000 MHZ on side A. You can tune down but not up. I didn't test this in UHF. On side B you can tune the shift amount up or down. I guess if you are going to use your radio only with software configured channels these settings don't matter. But if you use the VFO you should turn ARS OFF and RPT MOD OFF in the radio's set menu if you are tuning around in the simplex frequency slots. It might seem that I'm picky but not really The radio in my car is almost useless for UV/VU UU/VV operations since one side of the radio interferes with the squelch in certain channels combinations and Main/Sub settings. The only thing it does well is talk. The display you can hardly see in the dayligh the backlight is so dim even though blue and green are 36 and red is 30. Gives me a nice blue on the base radio. Don't want to run the Yaesu FT8900 mobile. I'd lose a lot if it got ripped off. I only ended up paying about $150 for the SUV radio so no big loss. Also on that radio some of the side A digits don't work when it's really cold out until the radio warms up. So no I can't be real picky huh? I have a remote head from a prototype. Sent as a replacement. But it wasn't made for a speaker mic and all the Set menu functions are stored in the remote head so it doesn't even have #55 HND SPK in the menu. Plus the microphone DTMF button backlight doesn't work. So the only use for that prototype head would be parts. I can't even take it apart, don't have the right size shaft nut tool. These are all slotted, not hex nuts. And they are two far down in the shaft hole to use a pair of needle nose to turn them, an old trick I learned a while back.

Well this is my rant for the day.

By default it just makes noise. But in the QPS5888 Anytone software you can set up some options for the emergency mode. Not sure if it will transmit a signals and series of DTMF tones to a specified frequency and I'm tired of messing around with the radio and settings today or I would give you a better explanation. You can always check out the options in the software yourself.

I read an article from Slashdot that said Yahoo has implemented
a change in their email that will filter email from other domains
from a list other than Yahoo groups. This will cause your email to the list
to bounce when your email gets echoed back to your Yahoo account.
I've noticed a bunch of soft bounces on the Yahoo list and none of my
post get echoed back to me from a Baofeng group not on Yahoo. As long
as you send from a Yahoo email account to a Yahoo group you are ok.
This is utter bullshit to me. Others like Comcast have also put in place the
DEMARK set of rules for their email. I checked the group's list of bounced
email and it is extensive. Hell even I had dozens of bounces while Yahoo

was tweaking their filters. I really want to stand up and scream at the top
of my lungs over this.

I don't see a problem with 1200 baud packet. Wire up a piece of CAT5 with a plug on one end and pop it into the mic jack. People use the external mic jack to run 1200 packet on a hand held. 9600 baud usually involves a separate audio path. Radios that advertize they will do 9600 usually use a rear mount data port with a separate pin for 9600. And if you look what's after the jack on a schematic you will see some extra components for filtering or to provide gain control.

Gotta give credit where credit is due...

First with the bad or not so good, ordered a car charger thing (to turn the radio on / off with ignition) and a non dtmf mic for the 588 from Universal Radio March 3rd. No ship notice for a week. Sent an e-mail, and they said it's on back order and should ship March 20th. March 28th the mic was still out of stock. No ETA.
Late wednesday I ordered them both from Radio City (www.radioinc.com). Arrived today.

No, I'm not affiliated with either. And I'm not slamming Universal Radio, it's not their fault if they don't have inventory, but I think the backorder could have been handled better. I never got notified until I e-mailed them.

2976. Re: [Anytone_AT-588UV] Good dealer

Next time order using their 800 phone number and ask specifically if the items you order are in stock.
I bought a Signalink USB audio and PTT interface for digital modes because my old AEA 232MBX just
wasn't cutting it these days. Found one at DX Engineering. They said the cable for my HF rig and the
Signalink were out of stock but they were expecting them the next day. I said I would call back. I did just
that and they said they arrived and they are just putting them on the shelves so I went ahead and ordered.
They arrived in two days via USPS. So there is no need to discourage anyone from dealing with Universal.
Just ask if the item is in stock and a tracking number via email. That did that for me when I bought my HF
rig there in 2011. A year later I bought the Alinco automatic tuner and a 6 meter vertical from Universal. They
said in stock and I placed the order. Here in a couple days.

From: jasedude2003@yahoo.com
Topic: 2977 Message: 2977

About a month ago I was asking about antennas. Several of you gave suggestions and I appreciate that! Anyway, since I use my rig for public safety purposes I need an antenna that goes from 150-172mhz and 460-480mhz. This has been a challenge.

I finally found a Tram 1181 and so far works great. I still have some range issues on the VHF and am thinking I just need to get a SWR and tune the antenna a little.

I had been using a longer Tram antenna and found it worked great on UHF, but terrible on VHF. My thinking was to get an antenna switch and use multiple antennas. The only set back wiuld be if I ever needed to cross band repeat.

Any ideas???

As always thanks for your input.....I am slowly learning!!!

Jason you can get a triplexer from Diamond that covers
BPF covers 110 - 170 MHZ
HPF covers 300 - 900 MHZ

You don't need a switch but the HPF connector is an N type.
The BPF is an SO239 as is the mix connector. Diamond
doesn't make a duplexer that goes past 150 MHZ for the HPF.

And the reason UHF seems to work better in a dual band antenna
is they typically have twice the gain for UHF Usually 3db for VHF
and 6+ db for UHF.

So with the triplexer you can still cross band and it would be much
better than a dual band antenna. You wouldn't suffer the desense
near to the degree you do with a single dual band antenna.
A proper repeater always uses two antennas and a properly tuned
cavity duplexer or a separate receiver and transmitter.

Milton.

Diamond® Antenna ~ MX2000N Triplexer

Diamond® Antenna ~ MX2000N Triplexer
MX2000N Triplexer Specifications: Port: LPF/BPF/HPF Frequency (MHz):
1.6-60/110-170/300-950 CW W: 400/400/250 PEP W: 800/800/500
View on www.diamondantenn... Preview by Yahoo

Well the LPF and BPF are actually PL259's so for the BPF you just need a barrel

connector. The N type you would need an N to SO239 converter or make

your own with a female N and SO239. You can order that stuff from Mouser Electronics.

Well Evan your intent probably wasn't to discourage but that's what happens.
And honestly does it take more of your time to make a call, verify the availability
and place the order? And I don't always call places. Like Amazon. They usually
state the availability. I ordered a new LiOn battery for my Hitachi cordless drill
from Amazon. $40, $5 to ship and in stock. It arrived in 4 days. Why the battery
died is an enigma. It was hardly ever used as it was one of two batteries. And I
always tossed it in the charger for an hour maybe one a month so it wouldn't
suffer a polarity reversal that can occur if a LiOn battery loses it's charge.
Well I didn't mean to ruffle your feathers if I did, like you it was my $.02.

2983. Receiving AM aircraft on both sides?

Yahoo group: Anytone_AT-588UV
Date: 2014-04-22 14:34:05 UTC
From: <gjgecik@...>
Topic: 2983 Message: 2983

Here in Cleve., Ohio during busy air traffic at Cleve Hopkins Airport it seems that from my 5 mile away location that they use split frequencies to communicate with aircraft on approach and tower. For example, on approach I hear the Approach Tower dispatch loud and clear on 126.550mhz AM and planes respond on 124.000mhz AM loud and clear. I need to keep turning from one channel to the next and back again to hear a coherent conversation. Is there a way to receive AM aircraft on both sides of the at-5888uv rather than just the left side? Is it possible a firmware upgrade (wishful thinking) might be able to fix this? Thanks for any input! Gerry G

You can RX on both sides by adding the frequencies to memory channels
and then tune the air to ground on say the left side and ground to air on the right.
I would think any channel you program into memory will be shared by both sides.
I'll give it a try here in a few minutes. Here is a list of Hopkins operational freqs.

Well I'll be danged ! Even as memory channels they don't appear
on the right side. I guess the right side receiver doesn't have the
bandwidth and IF and an AM demodulator. So it's a design limit
of the radio nothing that can be fixed. And I beet my Yaesu is the same
way because you can on;y switch through every band in VFO mode
using the left side. Only thing I can suggest is to skip all your other
frequencies from scanning and just scan your air frequencies on the
left side. Maybe someone has a better suggestion.

Unfortunately, the 5888 only receives A/C band on the Left side. All of the extended Rx frequencies are only available on the Left side. The Right side is limited to 136-174 VHF and the regular UHF.

I'll have to hook my 8900 and see what it does. I know the memories
aren't set up the same as the 8800. I'll grab it and hook it up and
report back. First I'll have a look at the service manual and flow
chart. I can see the signal path between side A and B. I know
I can only switch through all the bands on the left VFO.

From: Milton Hywatt
Topic: 2983 Message: 2989

Ok just reprogrammed the FT8900, same deal as the AT5888UV.
Will not tune to the two air channels on the right side. So like I said,
obviously with true dual receive there are two receivers. The left side
is set up with different IF and mixers allowing these extra bands
only it's VFO will tune. I also programmed 855.000, 29.600, and 51.000.
Those three channels will not appear on the right side even though I
can transmit on 6 and 10 meters. Design limitation.

From: <gjgecik@...>
Topic: 2983 Message: 2990

Thanks to all the responses on this topic. The best response was prob that the right receiving unit does not have wide receive with IF mixers etc...that the left side has. I did notice that after 1900hrs EST when flights start to slow down in volume, they did stop the split frequency communication and I can hear both sides loud and clear on both the single approach-frequency and the (landing) tower-frequency. Problem for me is solved for now till we can convince manufacturer to build both sides with full capabilities, sensitivities, and spectrums. I wonder if some of those quad band radios (25mhz, 50mhz, 144mhz, and 440mhz) coming out of China might have AM aircraft receive on both sides. Time will tell. Until then, I really like my Qixiang AnyTone at-5888uv as is works overall flawlessly for me. 73 to all...this is W8KYW clear!!!

Yeah it's unfortunate that they won't make both receivers equal.
Even on my expensive Yaesu FT8900 quad band, 10 and 6 meter
channels show only on side A. I'm just wondering if any Icom or Kenwood
2/.70 dual bander would show RX only bands like air, 350.000, 850.000. 220.000
on both sides. I would think the FT8900 since you can actually work 6 and 10 meters
would be setup to allow you to work both bands on side B. But that's not the case.

Also that list of frequencies does show that at times Hopkins reverts to simplex.
You can always tune in ATIS and get the runways in operation for the hour. I'm
sure you know what ATIS is and it's updated every hour. Pilots are supposed to
tune into ATIS when they start their approach and tell ATC that they have the current
ATIS that gives them what runways are used, taxi ways, altitude, cross winds, temperature,
and what frequencies for approach and departure, tower and ground control.

Subject: [Anytone_AT-588UV] Re: Receiving AM aircraft on both sides?

Thanks to all the responses on this topic. The best response was prob that the right
receiving unit does not have wide receive with IF mixers etc...that the left side has. I
did notice that after 1900hrs EST when flights start to slow down in volume, they did stop
the split frequency communication and I can hear both sides loud and clear on both the
single approach-frequency and the (landing) tower-frequency. Problem for me is solved for
now till we can convince manufacturer to build both sides with full capabilities,
sensitivities, and spectrums. I wonder if some of those quad band radios (25mhz, 50mhz,
144mhz, and 440mhz) coming out of China might have AM aircraft receive on both sides. Time
will tell. Until then, I really like my Qixiang AnyTone at-5888uv as is works overall
flawlessly for me. 73 to all...this is W8KYW clear!!!

From: Milton Hywatt
Topic: 2983 Message: 2993

I've been using the FT8900 as a base for the past few weeks.
The AT5888UV is a very early build, #39 of the first 50 imported.
I had to replace the microphone preamp board in the control head
because the AGC was faulty. So the dealer sent one to me. But the
display backlight is weak even though blue and green are at 32 and red about
15. Also side A the digits in the LCD don't all display if the radio is cold.
Once I get a shaft nut driver I can remove the faceplate and replace the display
and the lighting as I have a control head from a prototype. I'd just swap
control heads because it works fine except it's not providing power to the
keypad backlights, the active side indicators. So obviously it not giving the mic the
5 volts nor is it providing RX and TX indication and that is all serial data
into to the mic. I took the newer AT5888UV and put it back in my SUV
Now I can read the display under any lighting at any temperature and
I don't have to put up with all the anomalies these radios had with their
first firmware build. I took a spare AT5888UV prgramming cable I had,
chopped the RJ45 off the end and sildered on a 6 pin mini DIN plug so
I could program the FT8900 and not have to use an old USB to DB9 and DB9
to 6 pin mini DIN I was using. The drivers for the cable were from Win 2000.
None written later. And while I was able to install the driver in Windows 7
it didn't play nice with the Prolific 3.2.0.0 driver I had installed for my two
Prolific cables. When the cable was plugged in, both other COM ports would
have the yellow question mark besides them. When the cable was unplugged
the Prolific cables would get different COM ports assigned. So I had enough
of the musical chairs COM ports and modified the spare Prolific cable. Now
everything stay where I have it. If I plug a Baofeng or Wouxan, they use COM3.
AT5888UV, COM4. Yaesu FT8900 COM5. I recently spliced in a stereo 3.5mm plug
to the Yaesu cable for my FT60 and VX5. And have an FTDI based cable for my
GRE PRS 600 digital scanner with home made adapter to allow it to work with
my Alinco DX-SR8T HF rig if I want CAT control of the rig. And all 4 cables
remain permanently plugged into their own hub so COM ports don't change.

2994. Car charger quirk

Yahoo group: Anytone_AT-588UV
Date: 2014-04-24 16:58:49 UTC
From: Evan Platt
Topic: 2994 Message: 2994

So I 'installed' the car charger cord so the radio would turn on / off with the ignition.

Problem: All my 'accessories' are wired to a second battery through a battery tender.

So what this means - when I turn off the ignition, all my aftermarket stuff (radios, etc) will remain on for 30 minutes. I can extend this with the push of a button, but otherwise, radios and such remain powered for 30 minutes after taking the keys out, and then turn off. The second battery only gets charged when the car is running.

Near as I can tell - this causes the anytone on / off with ignition to not work. If I sit in the car, and put the key in and to 'on' (not starting), then turn the radio on, the radio turns on. Take out the key, radio goes off. Put key back in to On, radio is on. Take key out, radio turns off.

BUT - if I wait 30 minutes (or more), the radio doesn't turn back on.

My GUESS is it's getting confused since while the car charger cord gets powered off, the actual radio itself is still getting power for 30 minutes.

I do have an accessory car charger - a 3 unit accessory custom installed, however that is powered all the time off the main battery.

So my dilema - I can try putting the car cord for the anytone in the constant powered jack - that MAY work based on what I'm seeing with the way it is now, but hopefully it won't be a major draw on the battery....

2995. Re: [Anytone_AT-588UV] Car charger quirk

The radio power source should not be switched. It should be a steady
12 - 15 volts. The cable that you purchased should be plugged into a
source that turns off and on with your ignition key. My accessory plugs
all stay powered up forever. However there is a 12 volt source built
into the SUV that allows you 10 minutes of radio and window operation
with the key off. I don't see the radio working as you wish unless it's
power source is connected directly to battery voltage and your power on/off cord
connected to a source that energizes when the key is turned to ACC
and de-energizes when the key is in the off position. You could probably find
a source on your fuse block using a volt meter or 12 volt test light.

I'm not following you about this Car Charger Cord. Is this the QCC-01 Cigar Plug Connection Line?
If so that must switch on and off with the key, the radio must be wired to a constant 12 volt source of at least 20 AMPS.
It's just not going to work any other way.

OK good :) It's not supposed to work any other way than I described.
It allows a radio hooked to constant 12 volts to turn on and off with the
key instead of you pressing the power switch. That's in in a nutshell.
However the radio can still be turned on manually with the power button
if your ignition is off.

From: Evan Platt
Topic: 2994 Message: 3000

So far - in short tests - it's working how I want it to.

Car charger cord connected to plug that 's always powered.

Radio connected via second battery which shuts off 30 minutes after ignition.

Turn off car - radio is still powered. Disconnect radio from power (simulating battery being shut off). Radio turns off. Plug radio back in (simulating turning on car), radio starts up.

Crossing fingers!

My FT8900 99.999 % of the time will power on if I turn the power supply off while it is on. I had it stored in my radio cabinet and when I hooked it back up after it was in storage as soon as I turned the power supply the FT8900 lit up. So I must have

shut the supply down first a couple months ago before pulling it off the bench.

And that's also happened occasionally with the AT5888UV.

From: <sobbits97@...>
Topic: 3003 Message: 3003

Hi.
I currently use my Anytone in Part 90 service. I recently had to change some of the programmed frequencies. I step up the file and tried to write to the radio. I got an error message "SetCommDataByFrequencyError".
I was able to download the old program so the cable is working. I thought perhaps I set the new program data incorrectly so I tried to reprogram with the previous data. Same message.
Any thoughts?

Bruce

Topic: 3003 Message: 3004

The cable has to transmit and receive serial data to work. There is a slight possibility the cable is bad. I've not seen the error message but assume you are using the factory software. My guess is that rather than having a bad cable you've programmed something out of range. If you made a backup before you made the changes restore your radio to the original configuration. You can also do a factory resume that wipes everything out. Then you use your backup to restore. I did this a couple weeks ago on one of my AT5888UV that wouldn't transmit in VFO more ony in the VHF band. But as far as a precise answer goes,
you won't get one.

I had done a factory reset as I couldn't access the VFO. The reset restored the VFO function to the V/M buttons. I didn't download and backup the old program as I saved my original file. When I tried to upload the same data I used the last time, same error message. I rechecked the model and it was still set to band 1,US. Wouldn't the fact that I can download from the radio (factory spec) indicate that the cable was working?

So ... it doesn't work. Or it does. It's hit or miss.

What I think the solution may be - I don't see why this won't work - is to wire the accessory car charger ports I have to that second battery via the battery disconnect device? This way, both the radio and the 'car charger cord' will shut off at the same time - I see no reason why this wouldn't work, right?

Can't say yes or no. You have some unconventional power system in
your vehicle. That usurps the normal configurations.

So ... it doesn't work. Or it does. It's hit or miss.

What I think the solution may be - I don't see why this won't work - is to wire the accessory car charger ports I have to that second battery via the battery disconnect device? This way, both the radio and the 'car charger cord' will shut off at the same time - I see no reason why this wouldn't work, right?

What is the polarity of the Switched power sense jack (Charging) on the radio. The way I understand it this plug is wired to a 12v source that is switched in the vehicle, with the accessories, so the radio knows to power off when the ignition is cut off even though it is wired (main power cord) straight to the battery. I am trying to find the polarity of the jack on the radio and what size fuse should it have in the line? I have the parts to make the cord.

Thanks,
KK4PIW

There is someone here that bought one and we were talking about it
maybe a couple weeks ago. His name is Evan Plat. Maybe he can chime
in even though he's not really that handy with electrical stuff.
I would assume the tip is hot and the sleeve is ground. You can take
a plug, plug it in and see which is ground with an ohm meter. The other
connection will be the hot side. I'd use about a quarter amp fast blow
fuse just to start with in the test. If you still had the polarity wrong you
won't likely hurt anything But I think you can use an ohm meter to find
ground.

Don't use an ohmmeter to test anything in a live circuit (power is applied), or you will almost certainly damage the meter. If you want to test with voltage present, use a volt meter.

Looking at a picture of the QCC-01 online, it looks like the connector that goes into the radio is a coaxial type connector. Here is a check you can try to determine which is the negative part of that connector. Get one of the connectors and with the radio disconnected from DC power, slide the connector into the socket on the radio. Then using an ohmmeter, measure the two connector contacts to chassis ground and see if either connector gives you continuity (0 ohms or maybe 1 ohm or less if there is any reading). The other side should give you a substantially higher resistance. The side that has continuity to the chassis is your ground or negative lead. The side that has a high resistance to chassis is your positive lead.

If you purchase the QCC-01 itself, then the tip of the cigar plug is positive, and you can test continuity from there to the coaxial connector to see what part is positive and what is ground.

If you have the cord itself unplug it from the radio and power. Set the multimeter to The Ohms scale low end 200, 100 something lake that. Place one probe on the tip of the cigarette lighter plug and the other end to the sleeve then the center of the radio end of the cord. On either the sleeve or the center you will get a very low meter reading and that is what I need to know. The other piece is the fuse size. If you unscrew the tip of the cigarette lighter plug their will be a few small parts (tip, spring, etc) just notice the order they come out and put them back in the same when finished. The fuse will be labeled for voltage and amperage.

Thanks,
KK4-PIW

First of all get rid of the capital letters. Second, what version of the software are you using, v 100 or v 101 ? If it is 100 you may want to download the latest version because the first version was filled with bugs that caused that runtime error. The error is in the GUI of the software which must have been done in Visual Basic.

Open the software and in the upper left tool bar go to Model -> Model Information and make sure it

is set to band 1. I think you can set it this way. I use a utility from Anytone where you can set it to

band 1 or 2 so I've not used the actual QPS software to change it so let me know. I can get you the file
I know will change the band to 1.

Hi all,

Been doing some testing and here is the story on the AT-5888UV power cord and acc jack. The main power cord should be wired to a constant 12V power source that can supply at least 15A. Ideally this would be wired straight to the battery terminals. The acc jack on the radio takes a 3.4mm OD, 1.3mm ID power plug a Radio Shack 273-1711 plug will work. The plug should be wired tip positive and connected to a switched 12V power source. On when ignition switch is on and off when ignition switch is off. I used a 2A fuse in the line. The radio will power up each time the ignition switch is switched on and power off when the ignition switch is turned off. With the ignition switch off the radio can still be powered on by pressing the power button on radio.

The manual implies that the radio will remember the power state when the ignition switch is switched off and return to that state when the ignition switch is cut back on, but I did not observe that behavior. Each time the ignition switch was cut on the radio came on, regardless of power state when ignition switch was cut off.

Hope you find this information useful.

My interpretation was that 12 volts applied to the Acc jack would just turn the radio on and not preserve the last power state.

I received a new mic to try out. Still the same issue, no voice audio on transmit.

It is VERY DIFFICULT trying to troubleshoot an issue with no clue how the radio and mic is wired.

Two concerns with buying Chinese radios such as Anytone. If your going to buy one of these radios, buy it from a US distributor and if at all possible, buy a radio that has schematics and service manuals available. I will NEVER buy another Anytone radio. My Anytone is now a scanner. Ha.

OK, so what pin on the mic connector should have 5 volts? where in the radio does this 5 volts come from? Do you have schematics for the radio? Do you have diagrams you can share so I know where to look?

As I stated, I have no idea how to troubleshoot without a service manual & schematics!

Bob about the only diagram of the pinout is on page 10 of the manual showing which pin is 5 volts for the microphone. But past that, Anytone in their secret minds have not shared any kind of schematics for us end users which I truly do not know why.

Technically, full duplex means both parties can talk at once. Cross banding is bi-directional, meaning you have a frequency in the left side and a frequency in the right side. Anything received on A will be transmitted to B. Anything received on B will be transmitted to A, if that's what you mean.

Hey Evan,

Thanks for taking time to reply.
Yes, that is what I meant, had always heard that referred to as full duplex... repeat both ways. not just A to B side.

Thanks again
Tom

Yes, that's how it's designed - how most radios are designed. You are modifying a channel, but then when you leave, the setting reverts back to what's programmed in memory. You would need to copy the channel to VFO. Make the change, write the change back from VFO to memory. WHen you change a setting on a channel, it's dynamic, and is lost when you change to another channel.

Just program two channels - one with compand and the other without.

As an aside, it sounds like you equating compand with scrambling - two different things.

Good luck,

You have to build your memory channel in VFO mode then save it to a memory channel. Many radios are like that if they don't have a dealer mode. Those that do you can alter permanently the memory.

Garble on UHF <AT-588UV@yahoogroups.com>

-- Hi to the group.

Since new my unit has Garbled Audio on the UHF Frequencies. It is readable but annoying. I have not got into the unit as I don't have the proper documents.
When a station is not modulating heavy, it is much better. This does not occur on VHF. I check with other stations operating at the same time and they report NO rough audio.
Has anyone experienced this?
I have been reluctant to get into the electronics until I get more Info.
Thanks in advance for your assistance.

Hi All,

I'm not sure if there are any other groups that include the normal VHF/UHF Anytone radio's.

I'm Looking for the schematic for the normal AT-588.. not the UV but it must be a good quality one, I have one but you can basically see nothing on it as it's very bad.

I'm a reseller of this radio in South Africa and have a few of these radio's that have problems and it's really difficult to repair without schematic... China does not want to help me with this.

are there anyone here that might help me.. PLEASE

Thanks

Jaco

3100. Desk Mic

Yahoo group: Anytone_AT-588UV
Date: 2014-12-25 19:02:11 UTC
From: Tom Parenteau Jr
Topic: 3100 Message: 3100

I'm running a 5888UV as a base. I put a desk mic on it. The desk mic I have is sold as a "genuine Anytone product." It does not have channel up/down buttons on it. I feel like I'm wearing out the radio's clunk-clunk channel knobs.

Does anybody have a favorite desk mic for these radios that has channel up/down buttons on it?

3101. FS: Anytone AT-5888UV Complete Mobile Setup / Antenna / Programming Software

For sale is my Anytone AT-5888UV 136-174/400-490 MHz mobile radio. It comes complete as listed below. Pictures are available upon request. The radio shows absolutely no signs of wear, and is 100% operational. I have used it on VHF, UHF, and as a cross-band repeater. It works outside of the Ham bands too (if you have legal need to transmit there). I am the original purchaser, and have all of the original receipts. Here is everything that is included in this package:

Anytone AT-5888UV Mobile Radio Anytone DTMF Microphone (with Internal Speaker) Mounting Bracket and Screws Remote Mount Cable for Control Panel 12VDC Fused Power Cord Terminated in "T" Connector on one side / PowerPole Connectors on the other side. Anytone Box & Manual Anytone Programming Cable and Driver Disc RT Systems RPS-AT5888UV-USB Programming Software and USB-AR5 Cable Diamond K400 Deluxe Heavy Duty Hatchback/Door/Trunk Lid Mount Diamond C213SNMO 13.5' Cable with NMO Mount NMO Weather Cap and Hardware Tram Model 1181 140-170/430-470 MHz Dual Band NMO Antenna

$375 USPS Money - Includes shipping to anywhere in the lower 48 States. Please contact me with any questions.

73 - Don KA9RXK

I have the same issue. I have tried programming band 1 with both v1 and v 1.01 of QPS588UV_Setup_1.0x and CHIRP. In all cases, I get wrong frequency. My radio was manufactured 7/14

What software did you use to program the radio from band 2 to band 1.

Gentlemen:
Just a question, I ran into a situation some thing like that on those
radios. If your desired operating frequency does not fall on the
frequency step interval you set in, The unit will default to the next
programed step frequency interval.
Hope I made this clear....

I have 3 of them (bought at different intervals) and not experienced
that problem, although, as I think back, that may be how I know about it,

Don Jeerings.

Todd,
Yes, I want to change from band 2 to band 1.
 when I try to write to the radio with band 1 selected, it rejects.
I have no problem reading and writing if I stay within band 2 - but that does me no good.
The box the radio came in shows band 2 frequencies.

Just got my 588uv the other day and I am trying to program it. It took me a while to get the driver working for the usb cable, but now it seems to be right. I downloaded the repeaters form repeaterbook link in chirp and was able to write them to the 588uv. I then tryied to read the radio in to the qps program and then I get this message

"version is wrong. Overwrite? PC is V101 radio is V200 "

This same message show up when I click on the embedded message tab.
I don't know what to do about it. I need some help please. Thanks

Tom Yes you can upload your frequency and tones using chirp. but there is a catch... The anytone has a secondary setting in qps to turn on such as receive tones. Chirp at this time does not have the options to turn this receive tones on.

I'm starting to suspect my usb driver. I could not find a driver that would work for it, all of the ones I tried failed to connect. windows asked if it could do a search for one and it found the one I've been using. when i read from radio it informs-me that the driver is an experimental driver. I think ill try again to use a different driver and see what happens.

Glad I could assist there Darryl

did you end up installing the 3.2.0.0 driver to get it to play nice? Thats the issues with these chinese radios. Great radios, but they send low cost program cords. So its the game i have played and I had a hunch that was the issue.

Please note, the UV-588UV is not made by anytone, it is made by another Chinese manufacturer trying to latch onto anytone's reputation. That is why the number is one 8 short in name.

Doc, Are you sure the extra "8" is on the real Anytone ?
I have 3 of the originals (when they were first introduced and imported.
They have 2 figure eight digits.
One of them is still in the box (over a year old), Never been powered, I don't even know if it's has problems.
I have seen some advertised with 3 eights and wondered what the difference was.

I was indicating information about UV 588. As can be seen on https://hamgear.wordpress.com/2013/06/10/review-iradio-uv-588/. With Chinese radios one must be careful of names. Iradio makes the UV588 but not Anytone. I'm just pointing out that to use the nomenclature of UV588 and call it a UV5888 it could be confused one for the other. BTW, the I UV588 is a handy talkie not a mobile.

Confusing the two could result in difficulty in programming.

I have the AT-5888VU. Program it with supplied software. No problems.
Tried Chirp just for comparison. It would not load. Go figure. 73

It's time for a final update, with the help of Todd (thanks Todd) we found out that I have a new version after all. It is version 2.00. Todd did some checking on the internet and found a version 2.00 software copy of qps. He has put it up in the files for the group making it available to all. I downloaded it and all is well, it works. Darryl

Is there any documentation that shows what FW 2.x brings? I know these radios can be FW upgraded, albeit with a $100 adapter. Curious if anything major was improved or added in 2.x over 1?

3137. Banks?

Yahoo group: Anytone_AT-588UV
Date: 2015-01-18 02:40:37 UTC
From: blackice@...
Topic: 3137 Message: 3137

Mostly using Vertex and Yaesu programming.

Is there a way to have select-able named (or numbered) banks with any version of the firmware? I have so many channels programmed it's hard to get to them directly.

Other than that and a dim lower button backlight this radio has performed well in all season mobile mounted.

Been looking at the TYT-TH8900 to add 46mHz-ish. Unless Anytone is listening!! Receive only would be OK.

Thanks,

Rick

3138. New Firmware Jan 2015?

Yahoo group: Anytone_AT-588UV

From: blackice@...
Topic: 3138 Message: 3138

I see there is supposedly a new firmware version out that requires a new mic board.

What does the new firmware fix or add?

Since I am not using the keypad mic at all, would it be possible to update the firmware without sending the unit in?

Thanks,

Rick

Well it was just brought to my attention by helping out a fellow Anytone 5888UV with programming issues using the QPS software that there is now a version 2. I did find the QPS version 2 software for the version 2 radio, and that software is in the downloads section.

The fellow owner where he purchased this radio, I'm assuming that they didn't know there was a new version as the site he was told to download software it only had version 1 and 1.01

Now on the differences I do not know what has changed or updated. From helping out this fellow owner on programming that the QPS software will now allow cut and paste within the frequencies that are listed so moving around freqs has now been active. I know that can be done with chirp, but some folks are not fans or users of chirp.

Other then that, I have no further information on the version 2 and hope some mystery owners will pop in with this new information.

unfortunately the Anytone UV5888UV does not have memory banking yet. Between the 2 sides of he radio, it shares the same 1 common frequency bank. Yes we all wish that Anytone would listen to use owners.

Wow, they give us literally thousands of available memory slots and no easy way to access...especially when driving. I have to twist and twist and twist to get to various sections of my programmed channels, just to switch while driving!

What a P.I.T.A.

Hopefully, someone will come up with a fix. Seems like a pretty easy firmware addition from the factory. Heck all my tiny HT Yaesu's can do it!

Rick

QPS 2.0? isn't that just a new version the programming software?

I am talking about the new version of the RADIO firmware released Around Jan. 14, 2015.

I'd buy a couple more of these if there is a reasonable amount of improvement!

Thanks,

Rick

The new version of the software is in the downloads section. As for upgrading the actual radio firmware itself, I do not know if there is any dealers that has the upgrade module. The radio firmware is not user upgradable through your personal computer.. I wish it was.

I have 2 5888uv's with versions 1 and 1.01.

Sounds like you are having low voltage problems. The radio will shut down if the voltage falls below a certain level but I can't remember what the low voltage threshold is. If using it in a car, have the engine running. Otherwise carefully watch your supply voltage under Tx load.

3157. No CTCSS/DCS scan for uhf freqs

Yahoo group: Anytone_AT-588UV
Date: 2015-02-06 16:40:59 UTC
From: jminn699@...
Topic: 3157 Message: 3157

My radio will not stop on scan on any UHF freq unless the squelch mode is set to carrier; the VHF frequencies work fine for CTCSS/DCS scan. If not scanning the UHF frequencies will open fine with CTCSS?DCS with the squelch mode set to CTCSS/DCS. Is this normal for this radio? I would rather not have to have my UHF freqs in rx carries squelch mode.

Thanks

Joe

3158. Radio has suddenly started to jump channels

Yahoo group: Anytone_AT-588UV
Date: 2015-03-16 05:00:54 UTC
From: jimbiram@...
Topic: 3158 Message: 3158

my radio is nearly two years old now and it's starting to act strangely. I will be talking and suddenly the radio will suddenly jump channels, almost like it started to scan for about 1-2 seconds. Sometimes I'm just finishing talking and it suddenly jumps and I miss the message from the other party before I can change back. I cleaned connectors in the mic, thinking a contact was dirty/loose, but it's still doing it. My next step to try is to remove the scan function from P1 to see if there is a problem in that button.

Any other suggestions out there? Otherwise this has been an awesome radio.

Thanks!

Perhaps dirty contacts in the microphone connector? You have already cleaned the contacts in the mic, which would have been my first suggestion, and I agree with your thoughts about reprogramming the P1 button. Methodical step by step fault isolation that you are doing is the way to go. Let us know what you ultimately find.

Did you try switching mics with your other 5888UV radios? If you have a backup template that's recent factory reset the radio and upload the backup making sure to use the image file for that radio. Some or most a Chinese radios will work only the radio that It was downloaded from, modified then uploaded back to. Not sure if the 5888 suffers the same quirk or not.

I have had my At588uv for over a year now. Something happened and the VHF side fried. I could only xmit maybe a 10th of a watt or communicate maybe a 1/2 mile away. The UHF side still worked flaylessly. So I researched and found a new unit. ALINCO 638T. I'm not knocking Anyone but have heard one they die they are dead. But so far my Alinco is great and a good replacement plus MTC radio in Texas offers an extended warranty for years on it. How could I go wrong???

Milton... Yes, I totally agree, It probably will come back to haunt me, Things like this often do, but unless there is a service bulletin on it, or it acts up again, there is little, I can do. I cant fix it till I'm sure it's broken.

I do have 2 more (identical) back up units, so I could take it out of service and compare it's internal voltages, resistance etc. with another one. (probably would not bother with servicing it.

Why do I have 3 units, Good question and hard to explain to the Wife..

One is installed in the Home office, and I can cross band into our local club repeater with any cheap Baofeng, from any where on the property, such as the lawn mower, machine hobby shop, my favorite lounge chair by the TV, the bedroom or bathroom. (I am 87, and the bathroom location is handy)

The second one was intended for the car, but was never installed, because the previous car owner had mysteriously cut the wires to the Cigarette lighter (so no one could smoke) , and I can't find where he did it.. (tracing wires on these later model cars (even with a tracer) is a real bitch.)

The third one (sitting in the box) was the result of a duplicate order, that was easier to keep than bother with the return shipping. It's never been powered up It and will probably become a club door prize or loaner to new licensed hams that have yet to get some equipment.

I own two radios. one bought outright at cost and a early release of the version graduated into mainstream from test bed. Both work good and both have their own set of quirks.mostly RX oddities that might be cured with a flashed update of the radio's firmware.i think I have $200 total in both and a third control head from a prototype. so actually more like 2.5 radios.

3171. Supplied USB to Serial programming cable fails on Laptop

Yahoo group: Anytone_AT-588UV
Date: 2015-04-04 15:01:51 UTC
From: blackice@...
Topic: 3171 Message: 3171

I have the USB cable as supplied with the radio. I have used the same version of the driver (and tried the one that comes with both versions of the QPS software 1.00 AND 1.01 I removed one before installing the other.

It works perfectly with my desktop PC running Windows XP however when I try with QPS installed on one of our Panasonic Toughbook CF-18's running XP Tablet it installs fine. Device manager shows the Prolific port installed (COM 3) all looks well. Except...when I try and read or write from the radio it gives the error:

Cannot Open Communication Port.

This seems to be because something is using the port, but I have no idea what. I have disabled the built in Modem via bios. There is a Pen Digitizer and a Touchpad on this version of the toughbook, however I do not know if/which COM ports they use.

I have tried various other drivers...no joy.

The Cable has a tag which reads:

Model : RPC-LM-U

PCX0194

And on the other side a big green "X"

Any ideas? I would really like to program the radio in the vehicle rather than disconnecting all of them each time and bringing them to the desktop machine!

Thanks,

Rick

It usually is a driver issue. Most cords have the fake chip in them. Go to the site miklor.com and there is detailed instructions and download for the 3.2.0.0 prolific driver. This driver is compatible with the fake chip sets. Take a look for the driver section on miklor. Let me know if that helps out

I know about the fake cables and the like, but I do not have a "yellow exclamation mark error" in device manager. The cable is working fine, in fact the same driver version works on the desktop without a problem.

I just found and deleted 70 COM ports, mostly Toshiba BT on the Tough Book. No change. The only COM port I have now is the Prolific one at COM3.

Still indicates Cannot Open Communication Port.

No idea why....

Rick

Rick.
Just because there is no yellow explanation point doesn't mean the driver is going to work correctly with those cords.

But you sound like you know what your doing so good luck with it.

STILL messing around with this.

I have the cable and radio programming working on 4 machines now. The only one it will not work on is the Panasonic ToughBook CF-18

All of them are on COM3 (Though I have tried COM1, COM2, COM3 etc.)

Crazy, I have the same USB to Serial Prolific driver running 2.0.13.130

Have tried:
2.0.0.18
2.0.0.2.1
2.0.2.8

All the same issue. The driver works fine on another USB to Serial Cable (this one goes to DB9 I use it to program various Vertex Standard Radios. Works fine on the Laptop and all desktops with the same driver.

I got the first radio AND the USB cable from Lentini Comm in CT. No problems before.

HAS to be something odd about the Windows Version (2005 Tablet) or the Tough Book CF-18 hardware.

Any ideas??

Rick

Rick,

Make sure that all onboard COM and parallel printer ports are disabled in the BIOS and see if that makes a difference.

Paul, Great idea...no joy though. Turned off everything in the BIOS and still have issues.

very weird.

Has to be some solution though since lots of other usb-serial are working ....though none with this cable config. Wonder if they ever made a DB9 serial version..since my USB to DB9 adapter works fine.

I do have a few RJ style cables for motorola's like that but have no idea if the pinout is the same.

3180. Cannot Insert Row In Chirp

Yahoo group: Anytone_AT-588UV
Date: 2015-04-22 03:49:22 UTC
From: Tom Parenteau Jr
Topic: 3180 Message: 3180

I wanted to add some channels, but I ran into a problem I've never had before.

Chirp reads from radio just fine, first try. I increase the number of memory slots to add some channels. No empty memory slots appear. When I try to insert a row, it says there isn't room. If I hit "Refresh," the screen goes completely blank and the program becomes useless.

Same thing happens after power cycling everything, installing the latest daily build, not adding memory slots, trying over & over to insert a row, re-loading existing file from radio.

Never seen this before. At least I still have the same old channels.

Manually from the radio itself? I think I'll consult the dreaded manual. Should have over 700 memory slots to use.

I have 124 channels in there now. I suppose I could just over-write some of the ones I never use and be happy with it.

I did not make myself very clear. On the main Chirp page after reading a radio, there are two blanks to set the number of memories. If the selection is smaller than the number of programmed channels then you can't add more.

3184. RE: [Anytone_AT-588UV] Cannot Insert Row In Chirp

Yahoo group: Anytone_AT-588UV
Date: 2015-04-23 04:46:40 UTC
From: Tom Parenteau Jr
Topic: 3180 Message: 3184

I deleted 12 channels I never use, and replaced them with some that I wanted to load.

Every time I "Insert row above," Chirp says it's moving 6- or 700-something memories. So I know the radio has all its channel slots.

But when I change the Memory Range to go above 124 channels, Chirp claims there is no room to "Insert row above" or below. Then it freezes and quits working altogether, has to be re-started, and does the same thing again.

As long as I stay limited to 124 channels, Chirp works fine.

Ok guys I've got a AT-5888UV that transmits just fine on uhf, but on VHF it only puts out about 70 milliwatts. Voltages on the input and output of Transistor are correct, but the transistor gets very hot very fast, will burn your finger in about 5 sec. I have replaced the transistor and have the same results, so I can only assume that something in the duplexer on the VHF side is shorted to ground. if anyone has any info on this problem, or knows where to send it for repairs, i would greatly appreciate any help I can get.

My radio had similar loss of TX power. Fortunately it was in Warranty, (18 months, I think, on Anytone products). According to the packing slip, the folks at Tekk replaced D604 then tested the radio. It has worked fine since that repair.

I got info on the US repair depot from Import Communications. The radio ended up being returned to me on a Tekk label. I do not have their address.

Hope this helps!

Greetings,

My radio had similar loss of TX power. Fortunately it was still in warranty, and I sent it in for repair. According to the packing slip that accompanied the returned radio, the folks at Tekk "replaced D604 then tested" the radio. It has worked fine since that repair. I do not know where D604 is located or its function, but you may want to look at that part.

I got info on the US repair depot from Import Communications, but I do not have the details at hand. The radio ended up being returned to me on a Tekk label, with Tekk packing tape closing the box.
Hope this helps!

Greetings, My radio had similar loss of TX power. Fortunately it was still in warranty, and I sent it in for repair. According to the packing slip that accompanied the returned radio, the folks at Tekk "replaced D604 then tested" the radio. It has worked fine since that repair. I do not know where D604 is located or its function, but you may want to look at that part. I got info on the US repair depot from Import Communications, but I do not have the details at hand. The radio ended up being returned to me on a Tekk label, with Tekk packing tape closing the box.Hope this helps!Carl. Hell0 All,

With our Skywarn group, I most times am the net control operator. Trying to hold on to the mic, penciling in the log, reading out warning details off the computer. It just is a PIA! So I am in search. Has anyone made a attempt at making a headset. I am looking for info on what type mic I need to look for in a headset and some type of wiring diagram would be great. And yes I know about the very little info'd mic diagram in the manual. So if anyone can make my net control life easier, It would be appreciated.

After consulting Trigertronics, I have ordered a RJ-45 SWITCH. Not a spliter. This way I don't have to disconnect devices when changing USB to Mic. Technician stated that while they have not tested this setup, it should work. I ordered my switch today, and I will update the group on the results. 73 Kevin, KE5HYA.

3202. SignaLink USB jumper diagram

Yahoo group: Anytone_AT-588UV

I uploaded to PHOTOS and attached to this post, a color diagram for jumper placement. BLUE jumper connects Pin 8 to G, YELLOW jumper connects Pin 7 to PTT, RED jumper connects Pin 6 to MIC, GREEN jumper connects Pin 5 to G. You also must connect audio cable from your radio's external speaker jack to the speaker jack on the back of the USB. I hope this helps. 73 Kevin, KE5HYA.

has any one suggested a way to reduce the strain on the mic plug in. Radio is set for right hand drive cars, not left hand drive, so the cable is strained coming out of the radio. The drawing on page three of the instruction manual is incorrect as the cable is coming out of the left side, not the right side. Thought I could take the front panel off and reverse it, but that was TOO EASY.

Try using a short CAT5 Ethernet jumper with RJ45 plugs on each end. One end into the mic jack, the other end into one end of an RJ45 coupler with the mic plugged into the other end of the coupler. Quick check shows all available on Amazon for less then $20 total. Hope that works.

3207. TWO ITEMS

Yahoo group: Anytone_AT-588UV
Date: 2015-09-11 08:02:20 UTC
From: tmmccrann@...
Topic: 3207 Message: 3207

is there a way to block a channel from scanning from the front of the radio. Probably go through the menu, or I can use software, but havn't figured out if there is a one button to block a channel while scanning. TWO, is anyone came up with a group concept, rather than scan the whole radio, just a group, similar to what the Kenwood D700 does, scanning 20 channels or groups of 20, or the whole radio.

3208. Re: [Anytone_AT-588UV] TWO ITEMS

1. You can take a memory out of the scan list by turning the channel nob, or use your microphone to get to that channel location. Next hold in the scan button and it will beep twice and that will take the location out of the scan list.

2. Unfortunately, currently there is no memory banking on the 5888UV. There is only 1 master list on which either side uses that list. Example you take channel 3 out of scan list in Band A, it will also be out of scan on Memory B.

i WAS IN ERROR, You can load the radio or read the radio with Chirp, then export a csv file. Then this file can easily be read by excell or a spreadsheet program or any program that reads csv files. Pasting , I had had troubles but reading a csv has never failed.

3219. harmonic problem

Yahoo group: Anytone_AT-588UV
Date: 2015-12-03 06:35:17 UTC
From: tmmccrann@...
Topic: 3219 Message: 3219

I have a 5888 produced about july 1, 2015. When I put 146.760 - off set on the left side and 461.650 on the right, it producing a howl and indicates full;l receive on the right side. Thinking this was a harmonic problem, 461.650 is 3.1585249 greater than the input 146.160 so I calculated other combinations and came up with nothing. Can others, put this combination in their radios and see what they get?

3220. Re: [Anytone_AT-588UV] harmonic problem

Yahoo group: Anytone_AT-588UV
Date: 2015-12-03 12:50:14 UTC
From: Charles J. Hargrove
Topic: 3219 Message: 3220

VHF side = 146.760 Mhz; UHF side = 461.650 Mhz; I.F. = 10.7 Mhz

Let's take a triple harmonic of the VHF side and add double the I.F.:
(146.760 * 3) + (10.7 * 2) = 461.680

In reverse: 461.650 - 21.4 = 440.250; 440.250 / 3 = 146.750

Considering your signal is up to 15 khz wide, this certainly works
as the bandwidths are wide enough to be affected. In other words,
the two sides of your radio should not be on a harmonic of each other
at the same time. This is also a bigger problem if they have the same
PL/DPL or are in CSQ.

appreciate the response but the transmit is 146.160. The repeater input of 146.760. With the input, the calculations are off. Using the calculations I have tried other frequency combinations, and they appear satisfactory. I tried 146.760 simplex with 461.650 and the radio is quiet. I'm still waiting to hear others have the same radio responses. The input is what generates the interference or response. Multiplying other inputs and adding the double the I.F. generates nothing. I have determined that I have a far off station using 461.650 but their signal is maybe s3 while I am generating a full scale response on 461.650. A friend reported this, I put in my radio the same frequencies and got the same interference.

..

I have an even odder issue with my TYT 9800. Haven't seen a solution yet:

So if I put in 151.445 in VFO (or in memory) on the right side of the radio - might be other frequencies but I definitely see it with that frequency) - almost the entire 150-160 on the left side of the radio is now the weather channel.

So to duplicate:

VFO, 151.445 on the right radio (PL shouldn't matter).
Left side - VFO. Tune from 150-160. You should hear the weather channel - assuming obviously you are within range of the transmitter. Unfortunately I'm not sure WHICH transmitter I'm picking up, but it's the WX channel.

I could see you have a receiver overload problem, I am set for uhf on the right side, I get s6 interference with 150.000 on the left and 151.455 on the right. Just dial and no transmit. I guess there will be other interference or birdie interference.

I have an even odder issue with my TYT 9800. Haven't seen a solution yet:

So if I put in 151.445 in VFO (or in memory) on the right side of the radio - might be other frequencies but I definitely see it with that frequency) - almost the entire 150-160 on the left side of the radio is now the weather channel.

So to duplicate:

VFO, 151.445 on the right radio (PL shouldn't matter).
Left side - VFO. Tune from 150-160. You should hear the weather channel - assuming obviously you are within range of the transmitter. Unfortunately I'm not sure WHICH transmitter I'm picking up, but it's the WX channel.

Recently purchased a new desk mic, QDM-01, for my radio. Less than $30 new from Radio City. Anyway here is a dumb question. It nhas two buttons, one with a lightning bolt, to transmit, the other with a speacker icon. What is that button for. I search the web for a user's guide, but could not fing one.Mic works great.

Second button generally either turns off PL tone or opens squelch allowing you to listen for traffic before transmitting. Not much use in closed systems.

3228. No UHF receive while it's in the MAIN band

Yahoo group: Anytone_AT-588UV
Date: 2015-12-26 00:00:37 UTC
From: sam98177@...
Topic: 3228 Message: 3228

I can transmit on a UHF frequency is selected as a MAIN band, but it will not receive in while selected a MAIN band. I can receive the UHF frequency while its in the SUB band.

VHF works just fine. Is this a firmware problem or a setting problem. I've gone through all the settings, manuals and Googled and cannot find a fix. This is my 3rd AT-588UV and my buddy has three, also, and we cannot figure out the problem.

Any help would be much appreciated,

Sam

3229. Audio Issues in Cold Weather

Yahoo group: Anytone_AT-588UV
Date: 2016-01-08 05:19:40 UTC
From: cjmelhorn@...
Topic: 3229 Message: 3229

I have had my 588UV for several months, starting in warmer weather.

I have found that I have a loss of audio when it is cold out. It seems to eventually warm up, but no real rhyme or reason to it.

What I found odd was at one point I had audio when the truck was off, but then lost audio when the truck was on....which eventually restored.

Has anyone seen issues like this before?

Thanks,
CJ

That is interesting there CJ,

The only cold weather issue I have had of course with any LCD display is the slow and dim display till it warms up. But I haven't had a issue with audio.

Are you using a external speaker with this radio?

3231. Re: [Anytone_AT-588UV] Audio Issues in Cold Weather

Yahoo group: Anytone_AT-588UV
Date: 2016-01-08 15:16:42 UTC
From: CJ Melhorn
Topic: 3229 Message: 3231

I am now using an external speaker but had noticed low audio even when I didn't have one connected.

The thing that struck me as odd was when I turned the truck off and received audio.

I recently bought a true dual band window antenna, but doubt that's the issue. It has recently gotten cold here in NJ.

I can't see it being a ground or anything because the audio does in fact return and I was using the radio flawlessly since receiving it (in warmer weather).

The radio is direct to battery with ground to the chassis.

Thanks,
CJ

3233. Channel Interferance

Yahoo group: Anytone_AT-588UV
Date: 2016-01-14 14:28:01 UTC
From: cjmelhorn@...
Topic: 3233 Message: 3233

So this may be a tough one to pinpoint, but wondering if anyone has picked up on anything like this.

I have my local PD in my radio and they receive at 154.755 pl 179.9. The channel tends to pop a lot.

Now I just received a second radio and put that in my truck and the other one from the truck in the house, I believe I have the popping on both of them, almost like the audio cuts out, especially when a tone is going out.

I do not feel I experience this on any other channel, though I will say, this is used a primary channel in my truck and is always on....still, seems odd that it happens on this channel only.

Maybe it is something from the tranmission area? However I do not experience this on my AnyTone portable....

Thoughts,
CJ

Richard,
I mean when they transmit an EMS tone out....that pops heavily, but the audio pops constantly.

If you mean the PL Tone, I need that since I do not want to receive any other transmissions. CJ Melhorn E-Mail: cjmelhorn@...

From: cjmelhorn@...
Topic: 3233 Message: 3240

OK. So after testing (and purchasing another radio) I have found that this issue seems to be only when the unit is scanning.

It does not matter if I put the unit on a UHF channel or a VHF channel, when the radio is scanning on the other side it has audio interference and I am not sure why. This happens on both radios.

I am now trying to see if this is isolated to the partiuclar channel I am locked on to or if it happens to other radio channels that are locked on.

Thanks,
CJ

3241. PROBLEM WITH NEW 5888

Yahoo group: Anytone_AT-588UV
Date: 2016-02-12 20:00:29 UTC
From: tmmccrann@...
Topic: 3241 Message: 3241

First one failed 20 days ago. Would not transmit, showed no rf output though amps showed 7 amps on keydown. Unit worked good for two months.

This one, about a week old, get interference when the radio, in receive mode, has uhf ands uhf on both sides of the radio. Normally uhf right side, vhf left side. Left goes to scan, and when a uhf comes up on scan in the left side, the right side "clicks" in the speaker and shows a full rf signal on the right side. As soon as a vhf comes up on the left side, right side is quiet. So I switched uhf to the right and vhf to the left, left to scan and same results. With a vhf on the left or fight, as soon as a vhf shows up on the other side, same results..

Checked radio software and don't see anything out of the ordinary. Any ideas?

I've had my Anytone about two years now & I had this problem right out of the box.
I have always used / liked 2 meter repeaters better anyway. They have better range.
Although I imported several hundred repeaters (2 meter & 440) from my state & places I would likely travel to. I scan about a half dozen popular 2 meter repeaters on one side & monitor my local UHF police & fire on the other. As it turns out all my surrounding town police frequencies are on UHF.

Sorry this doesn't fix your problem, I liked many other Anytone features much more, so I live with this issue.

So far only way to operate radio is to put uhf on the right, then go in an add skip on scan,. All vhf will scan as long as one uhf on right. vhf on right, radio starts displaying interference from the other side. UHF works on right but you have to manually call up each channel that has a uhf programmed. Right side does not scan because as soon as a vhf frequency is detected, unit displays interference, full scale. First radio did not operate like this. Seems each Anytone 5888 has a mystery operation.. Radio has some neat features so I keep plugging away. Intermod detected, using a VECTRONICS intermod filter, takes care of paging, model VEC-814. Did NOT have intermod with the first radio.

CHECK the voltage going into the radio from your power supply. I was having shut down problems, power supply said 13.8, checked with a volt meter and I was at 14.1 volts. Now running at 13.5 volts, on the meter and a volt meter says 13.8. The fan, maybe you have some dust or foreign matter in the blades.

Todd and Mike,

Thanks for the ideas. The fan is free.
Checked the voltage with my fluke and it is 13.73 VDC.
Did a CPU reset but no change in condition.
Did a radio check on a repeater and it key up the repeater but audio
was crappy or unintelligible.

So: I am treating it as a scrap radio. No Anytone repair depot here.

Well here is another issue I am having with 2 of these units. One is a 100 program and the other is the newer 200 series. Been using these And several others for several years now as mobile units. Both of these units after being used for several months total loose all transmit power on only the VHF side. UHF is fine. After putting them to a different seldomly used base status they suddenly start working again. As far as I can tell there is no voltage or SWR problems. As I said 2 of the 6 units I have are doing this. Any suggestions?

Only thing that I did was check my power supply's voltage output. Set it at 13.4 and radio has operated perfectly since. I sent two back then got the third and it stated to act up. Before I packed it up, I check power supply output voltage, The supply is a jetstream jtps28m, it has a detent that is supposed to be set for normal ops. It displayed below 13.8, which iis what a car delivers , so I adjusted to 13.8, by the meter.Radios kept failing. Used the dent, 13.4 and radio operates perfect. I show better that 50 watts output on high power, by a diamond sx400 meter. I have a Telewave meter, same output readings.

I was messing with the radio and screwed up my power up settings. I couldn't find anywhere in the manual where it says how to program this. But some combination of buttons changes it from what it was so I assume I can change it back. Any ideas?

I'm looking to set the power up V/M mode for each side, as well as the default memory channel. I'd like to set which side is active as well, but not sure that is possible.

Any help would be appreciated.

Thanks

Mike

I know it's a little old but I didn't find the answer to this. You can delete these channels in the QPS software by going to limit channels, double clicking the RX frequency and hitting delete.

In the QPS it is under "Hyper1 CH Edit" and "Hyper2 CH Edit". I believe the radio defaults to booting hyper 1 settings for Mode: VFO, Channel, Home

All of this is programmable with the pc software the download it to your radio. I highly recommend it.

Also it should be programmable from the radio though I don't think it is as intuitive. If you go to menu 27 "HYPER" and change it to auto it will remember the last settings for that instance of Hyper Channel set.

with the software from Anytone, far right column, double click and you have all kinds of options. power for each channel is one option.

I am not sure of you question, but perhaps this writup on setup of Hyper Channels will be helpful.

Hyper Channels

Hyper Channel 1 gives you two pre-programmed channels that are selected by pressing the Left Volume Knob. Hyper 2 provides two more channels that are selected by pressing the Right Volume Knob. You can also select right or left as the Main channel.

Hyper Channel Setup

In the software go to Hyper1 Chan Edit

Set Mode (s) to Channel

Put desired channel numbers in Left and Right

Set Sub Display to Frequency and Select Left or Right to set the Main Channel

Uncheck all boxes on Right

In the software go to Hyper2 Chan Edit

Set Mode (s) to Channel

Put desired channel numbers in Left and Right

Set Sub Display to Frequency and Select Left or Right to set the Main Channel

Uncheck all boxes on Right

Write to radio

Now press Left Volume Knob for Hyper1 channels or Right Volume Knob for Hyper2 channels.

I almost misread the OP too. Mike wasn't asking about power or power per channel but settings on "power up" hereafter referred to as boot so as not to be confusing.

Thanks All!

Not sure if this is the right way to do it, but it was certainly easy.

I went to Hyper in the menu, changed it from manual to auto, set up the radio the way I wanted it, power cycled the radio then put the Hyper setting back on manual.

Now the radio boots exactly the way every time I get in the car, including which side of the radio is selected.

Thanks!

That's certainly one way to do it. You could have set everything in software, or changed the hyper menu to auto, made your changes and then back to manual. The best solution is the one you're most comfortable with! Glad you got it figured out.

From: Tom P.
Topic: 3268 Message: 3268

I have a brand new Astatic 878DM still in the unopened box. I ended up not needing it for the radio I originally bought it for. The re-stocking fee, shipping charge, and hassle of taking it to the post office make it hardly worth returning.

Should I try running it on my AnyTone 5888UV? Will I have an impedance mismatch and/or massive overmodulation condition?

Thanks,
Tom P.

Hi

Step 1) Read the mic impedance on the radio.
Step 2) Read the mic impedance of the mic.
Step 3) if they are different greater that 20 ohms, then build an "H" pad to match them.

That is the best I can come up with.

Also, test the mic audio pin for DC voltage, if present, use a .01 if cap for DC blocking.

not having the trouble of no power though I played with the power supply adjusting voltage because someone suggested bad ground or low voltage. At about 10 volts, when I key up, the radio lights flicker, then go out and the radio gives 5 beeps, not three as someone reported. I had this power out problem several months ago, but since I have monitored input voltage, and kept at 13.4 to 13.6, the radio has not dropped out any.

My contact was Dal Chung.
His email is,
Dal@...

73, Bob, AA8X

Does anyone know of where there is an authorized location where I can send the unit in for repairs?

William

Dal repaired mine and guaranteed his work. He would be my suggested place
of repair.

From: bscruz@...
Topic: 3294 Message: 3294

have software v1.01 on my Desktop and my Laptop. I finished entering all of the channels on my desktop, so I fired up my laptop, took the *.dat file off my desktop to my laptop via a thumb drive and tried to open it from the programming software on my laptop - it won't open the file and gives me an error "Not isNumeric". the error message stays on and I can't use the software anymore.

Go back to my desktop with the same file - opens up just fine. Back to the laptop again with the same file - error message and software locks up again.

Does anybody have any idea what is going on and how to fix it so I can get my mobile programmed?

The only thing off the top of my head would be sure that the radio selected on the other computer is the same radio you used on the original computer.

There are options for radios.....might be seeing a different model type.

How long an RJ-45 separation cable can I use before there is significant signal loss? Can I plug a 50-footer in and move the head unit all around the house?

I would expect that the limits would be determined by voltage drop and the degradation of the digital waveforms. The currents are so low that with any reasonable wire size, they would become insignificant in this application, and the issue would become a matter of digital waveform degradation.

If you use cat5 or cat 6 cable, not, (telephone cable, and keep the pairs straight) I suspect you might be able to use it in the back outhouse, or the neighbors pool area. Should you get to a distant point where it will not work, put a scope on it and check both, voltage and waveform.

Address it from an engineering standpoint, as hams are encouraged to do.

DJ

50' Cat5 has too much mic signal loss. Works fine for scanning & monitoring using an external speaker.

Yahoo group: Anytone_AT-588UV
Date: 2016-08-31 02:50:15 UTC
From: kb8yit@...
Topic: 3304 Message: 3304

Has anyone had a issue with the alarm going off when transceiver is in receive mode, A or B receiver it has done it on both. Power off and back on and it goes off again, not immediately about 10-15 seconds. Removed power from transceiver, re-powered a few hours later still have this issue.

Is it possible that the right volume knob button is depressed/stuck? Could be the contacts are damp and the radio senses it is closed. Also the manual mentions a theft alarm though I couldn't find any more information aside from that one mention...I'm wondering if that is about the remote kill feature.

3306. Re: [Anytone_AT-588UV] Re: Alarm

I 2nd the comment, check the right knob for it being depressed. Compare the feel to the left knob. Possibly you have banged the .right knob, or its dirty and sticking. Remove the head and see if that makes a difference.

It is standard CAT 5 cable, so if you have or know someone who has a connector crimper you can make one out of a spare cord sitting around.

From: cjmelhorn@...
Topic: 3310 Message: 3310

All,

I may or may not have posted in here before with regards to this...however, I have now two units that seem to have issues with weather. Reading the specs it says -20 to 60 degree C and it does not get that cold where I am at (or at least not so far), but I have had two of these radios now go without sound during cold weather.

This morning (after a spell of colder weather) even at 54 F I had no audio this morning.

I have used the internal and external speaker.

I was told these might not be geniuine since I got them off Amazon, but I am have serial numbers, etc.

My real concern (inquiry) is does anyone have issues like this? I have a friend who bought one and has no known issues with sound when turning the unit on.

Any info would be appreciated.
Thanks
CJ

Hello all,

A bit late to the party but I want to use my Signalink with my Anytone too. I'm currently using an HT an it's working OK but....

Can you please confirm that this pin configuration is working for you? Also I'm a but surprised to hear that you need to run the audio from the external speaker jack. The Anytone mic has a speaker built in. The audio has to be getting there somehow although none of the wiring diagrams I have found show it. Has anyone been able to crack that? Having to switch one cable instead of two for NBEAMS work sure would be easier.

Thanks for the help.

From: Zach Bender
Topic: 3316 Message: 3316

Thinking of purchasing the radio soon - Has anyone had any major issues with the radio , or faults that raise any flags, - or have things been pretty stable - eg finals going bad, front end dying etc?

Thanks Zach

4 years excellent service here. Great receive sensitivity. Gets a little hot during long chats, so I added an extra fan to the heat sink.

I had the Anytone radio about 3 years ago. It lasted about 6 months and died!!! I did more research and replaced it with an ALinco DR638T. The Alinco is the same radio, just a little more expensive.

I know of 6 Anytone AT-588UV radios that me and my friends purchased about 3 years ago and none of them have had any problems. It is dependable and have at least one freature that can be very helpful. Cross band repeat allows you to use your HT and still hit repeaters beyond the HT's range by crossbanding from your 588 base or mobile radio. The only additional feature that I would like to have would be a data port out the back of the radio for Digital Mode use.

I don't have the 588 vhf but I do have the 5888 vhf-uhf-four years old and absolutely dependable. I have used it for simplex, repeaters, and cross-band with no problems. Presently setting up a Tigertronics Signalink to feed data into the mic input with an a/b switch so I can use either the Signalink or mic without reconnecting either one. There is in this group several postings about the Signalink jumpers for the 5888 which may work on the 5888. I searched my email saved but could not find it-possibly one of those people will see this email and mention who had that info.

FYI, in addition to the Anytome, I have a Baofeng UV5r and a Wouxun UV2D, both about three years old and just as dependable. Chinese radios are OK by me!

Mine is almost 4 years old now and the only problem I encountered is the Mic developed a strange short in it after 2 years of use, causing the radio to mysteriously jump channels. A new mic solved the problem, though, which I picked up from Amazon. It is a great radio for the money and works well with Chirp as well as the factory programming software. Be sure to get a good antenna and don't go cheap. My first MFJ antenna didn't last a year, but my Diamond antenna puts out like crazy.

only problem I am seeing is the power drops off after 10 minutes from 50 give or take to 20. Radio very hot, think the fan is nor running. As soon as radio cool's off, everything back to normal. If I stay at 20 watts or less,I don't see any power drop off.

I have a very early AT-5888UV, which was the first mobile offering both Part-90 compliance and a cross-band repeater (I do SAR work, and use both regularly). I have had this radio in my primary vehicle for almost 5 years. My understanding is that the "newer" version of the radio is essentially nothing like mine, with considerable upgrades in reliability and function.

Failures:

- The radio stopped transmitting with more than a few milliwatts about 16 months after purchase. I sent it back for warranty repair (Anytone radios come with an 18 month warranty) and the folks at TEKK repaired it and I was back at full power. My understanding is that I had a well known problem that was fixed in subsequent versions.

- The microphone became intermittent about 2 months ago - replaced mic ($29) and back in business

- The front end in my radio is a bit temperamental in high RF areas (looses sensitivity). My understanding is that this was significantly improved in later versions as friends with the same radio do not report this problem.

Overall, I am happy with my selection and I would purchase this radio again (although I would be sure to get the newest version, as they keep improving.)

I have had 3 of them running continuous for about 4 years with no issues.

Truthfully I think most of the problems come from operation with high SWR' Remember to cross band you must have a 2 band antenna with both bands well tuned. (I mean well tuned), There are only a few good ones available...

The only protection they have is heat sensors, that back off the power and are slow to respond, You Can smoke any of them with a bad hookup situation where the temperature rises faster than the sensor can correct for it. Thermal Delay..

1.3 to 1 is not good enough.

I love the radio overall. My one issue is with manually programming using auto repeater setting on. Auto repeater overrides the progamed setting. Then having one repeater not follow the rules. So you have to turn off auto repeater setting to use that repeater. Then any repeaters you did not program an offset on other channels does not work correctly.
We have some repeaters in the area on 147.000 that offset up and others that go down.
Channel programming should override the general setting IHO .

Happy Connecting. Sent from my Sprint Samsung Galaxy S® 5

The 147.000 deal is a confusing deal to almost all radios. I just use software to program with and it takers care of this. The radio has enough channel space that you can program most everything. Using the "p keys", they can be set for positve or negative off set, where you could go to vfo and decide up or down. Or, just program some channels that have up and down setting, and add sub tones to these if necessary. No radio is perfect but Hams, improvise and over come.

Subject: [Anytone_AT-588UV] Re: Thinking on purchaseing radio - any major issues

I love the radio overall. My one issue is with manually programming using auto repeater setting on. Auto repeater overrides the progamed setting. Then having one repeater not follow the rules. So you have to turn off auto repeater setting to use that repeater. Then any repeaters you did not program an offset on other channels does not work correctly.

We have some repeaters in the area on 147.000 that offset up and others that go down.

Channel programming should override the general setting IHO .

Happy Connecting. Sent from my Sprint Samsung Galaxy S® 5

Ok, further check shows licensed since '12. Still a tech.Also, it was submitted by someone else.
That's a whole lot of EXPENSIVE equipment for a tech that can't use it just sitting around for five years.
I may be wrong and hopefully she is able to post pictures, serials, and answer some questions herself if she really has these items.

3335. Radio shut off, will not work?

Yahoo group: Anytone_AT-588UV
Date: 2017-05-29 02:46:58 UTC
From: bcvak@...
Topic: 3335 Message: 3335

In what I thought was a poor electrical connection on the radio due to battery corrosion that was shutting my AT-5888UV off turned out to be something else. Has anyone had this happen?
All fuses, connections to power are good, voltage is at 13.8V and the Dimond dual band pre tuned antenna is connected.
It seemed to do this when I grabbed the mic in hand and it would shut off. I checked the mic cord and connector and all seems in place. (I only installed the radio late last year in my van so the radio is relatively new).
So the next question is where to send it to have it checked. It was an inexpensive radio but surely only less than six months of rarely used service and kapuut, seems like it should be repairable....?

had a similar problem, traced back to the inline fuses and the t connectors. Wiggled the cables around, then they delivered power, to a point, then they shut off, or quit delivering voltage. Replace the power cable with a new cable, then took the t connectors off and replaced with new ones, Radio is fine now. The mic connectors takes a lot of strain, the way the mic plug into the radio so I run a cat 5 cable thenb plug that into a barrel connector for cat 5 cables cable, then plug the mic into that. This allows the mic to plug in straight, not at a 90 degree angle, thereby reducing the strain. You might try that, you just take a cat 5 cable and plug into a twin female cat 5 plug.

Thanks, I looked at those and thought they might be the culprit. But they were making contact at both ends with the connector soldered into the cradle fitting. I will look again but this sounds like the most plausible reason for not getting power, other than a blown fuse or some internal fiasco. KL2AN

I started pulling the cables when the power shut off and found intermittent contacts. That's when I just replaced the power cable, and had to put new t connectors on, as the t connectors from anytone were just a tad wide. Had to replace the connectors on the cable that goes to the radio then on the cable that goes to the power supply. The original t connectors actually melted through the plastic connector and I was getting a short, the crow bar circuit on the power supply shut off and the radio cycled down. The connector that went to the power supply actually had a slight bow or a bubble in the connector. Disconnected from the radio and the power supply and did a continuity check. I had a dead short.

I had to replace my mic after a couple years. It had developed a short in it, which would cause the radio to jump and scan through frequencies. I wouldn't be surprised if you have something similar going on.

3340. Please accept my invitation to Nextdoor

3342. DCS Column in Chirp

Yahoo group: Anytone_AT-588UV
Date: 2018-01-21 16:52:31 UTC
From: datsunboy@...
Topic: 3342 Message: 3342

When exporting a Chirp table from the 5888UV to a .csv spreadsheet, I lose any DCS codes. The whole column defaults to "23."
However, the CTS tone column populates accurately.

Is there a step I need to take to get the DCS column to load correctly from the Chirp table?

3343. No Audio on external speaker?

From a review: "The external speaker connector is unreliable. The only way to make it work is by inserting the 3.5mm plug firmly and pull it out slightly. One wrong move, one little tremble, and the audio goes dead. Probably easy to fix, but sloppy nonetheless."
Maybe a shim on the external 3.5mm plug would help?

Alfred,

Reason is the anytone has the 2 part process of to get squelch to turn on. Chirp never finished adding that feature. In a nutshell, you need to read the radio with the anytone software, then to the far right of each frequency there is like arrows. Click there and will bring up your tone squelch. Use the drop box to turn on the tone squelch. Save and upload to radio. Why the double step with the anytone no one knows. It's the same process with anytime ht's.

Todd KC9LOX

3350. Anytone 5888

Yahoo group: Anytone_AT-588UV
Date: 2018-03-19 13:18:53 UTC
From: William Peters
Topic: 3350 Message: 3350

I have a Anytone 5888 that I have had for about 3 years,I have had similar problems with my unit as well. It seemed to me that when I used other programming software my problems continued, upon some GOOD advice I changed SOFTWARE PROGRAMS to "RT SYSTEMS SOFTWARE FOR THE A-5888", this software is a little pricey,but, it sure eliminated all of my LITTLE glitches in the programming problem for me. (FOR INFORMATION ONLY)
Good Luck

I'm now having this problem too. Wow, I have to do that on every channel?
How annying :(

So... Certainly there's a fix for this? What if I have a channel with no PL?

From: Evan Platt
Topic: 3343 Message: 3355

So one problem fixed - was getting no audio on a speaker. Little Bearcat amplified (powered) speaker. Turns out the 5888 doesn't like stereo speakers - the bearcat speaker has a stereo (2 ring?) plug. Got a stereo to mono adapter, works great!

https://amzn.to/2qRcTRs

That's interesting because I have only ever run external speakers on my 5888. I use mono plugs, and have never had a problem. I don't remember trying the stock speaker at all.
